SAFETY INFORMATION

Important information

Read these instructions carefully and visually inspect the equipment to familiarise yourself with the device before attempting to install it, put it into operation, overhaul or service it. The following warning messages may appear anywhere in this documentation or on the equipment to warn of potential dangers or to call attention to information that can clarify or simplify a procedure.

The addition of this symbol to a danger warning label indicates the existence of an electrical danger that could result in personal injury should the user fail to follow the instructions.

This is the safety warning symbol. It is used to warn the user of the potential dangers of personal injury. Observe all the safety warnings that follow this symbol to avoid the risk of serious injury or death.

⚠ DANGER

DANGER indicates a dangerous situation that, unless avoided, **will result** in death or serious injury**.**

⚠ WARNING

WARNING indicates a potentially dangerous situation which, if not avoided, **could result in** death or serious injury.

⚠ CAUTION

CAUTION indicates a potentially dangerous situation which, if not avoided, **could result in** minor or moderate injury.

NOTICE

NOTICE used in reference to procedures not associated with physical injuries.

PLEASE NOTE

Electrical equipment should be installed, operated, serviced, and maintained only by qualified personnel.
No responsibility is assumed by Schneider Electric and Eliwell for any consequences arising out of the use of this material.
A qualified person is one who has skills and knowledge related to the construction and operation of electrical equipment and its installation, and has received safety training to recognize and avoid the hazards involved.

Personnel qualification

Only personnel with suitable training and an in-depth knowledge and understanding of the contents of this manual and any other documentation relevant to the product are authorized to work on and with this product. Qualified personnel must be capable of identifying any dangers which may arise from the parameterization or changing of parameter values, and from the use of mechanical, electric and electronic equipment in general.
Plus, they must be familiar with the personal safety laws, provisions and regulations which must be observed during system

Product related information

⚠⚠ DANGER

HAZARD OF ELECTRIC SHOCK, EXPLOSION OR ARC FLASH

- Disconnect all power from all equipment including connected devices prior to removing any covers or doors, or installing or removing any accessories, hardware, cables or wires.
- Always use a properly rated voltage sensing device to confirm the power is off where and when indicated.
- Before powering the device back up, fit back and fix all the covers, hardware components and wiring.
- Check the earthing connections on all earthed devices.
- Use only the specified voltage when operating this equipment and any associated products.
- Comply with all standards regarding accident protection and local applicable safety directives.

Failure to follow these instructions will result in death or serious injury.

⚠⚠ DANGER

HAZARD OF OVERHEATING AND/OR FIRE

- Do not use with loads other than those indicated in the technical specification.
- Do not exceed the maximum permitted current; for higher loads, use a meter with sufficient power capacity.

Failure to follow these instructions will result in death or serious injury.

This equipment is designed to operate outside all hazardous locations and is not to be used in applications which generate (or could potentially generate) hazardous environments. Install this equipment only in areas and applications known to be free from dangerous atmospheres at all times.

⚠ DANGER

POTENTIAL FOR EXPLOSION

- Install and use this equipment in non-hazardous locations only.
- Do not install or use this equipment in applications which could generate hazardous atmospheres, such as applications which use flammable refrigerants.

Failure to follow these instructions will result in death or serious injury.

For information regarding the use of control equipment in applications capable of generating hazardous materials, please contact the relevant national regulatory bodies or certifying authorities.

⚠ WARNING

UNINTENDED EQUIPMENT OPERATION

- The equipment signal cables (probes, digital inputs, communication, and the relative power supplies) must be laid separately from the power cables.
- Every end application of this device must be tested individually and completely in order to check its proper operation before putting it in service.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

HACCP Module - RCN•••••••••• MODELS

NOTICE
INOPERABLE EQUIPMENT For TTL serial line connection, use cables no longer than 1 m (3.28 ft). **Failure to follow these instructions can result in equipment damage.**

NOTE. For information on the cables to be used with the HACCP Module, contact your local Eliwell representative.

Permitted use

The device must be installed and used in accordance with the instructions provided. In particular, parts carrying dangerous voltages must not be accessible under normal conditions.
It must be adequately protected from water and dust with regard to the application, and must only be accessible using tools or a keyed locking mechanism (with the exception of the front panel).
The device is suitable for use in household refrigeration appliances and/or similar equipment and has been tested in accordance with the harmonized European reference standards.

Prohibited use

Any use other than that expressly permitted is prohibited.
The relay contacts provided are mechanical and subject to failure; any protection devices required by product standards, or suggested by good practice in view of obvious safety requirements, must be installed externally of the device.

Liability and residual risks

The liability of Schneider Electric and Eliwell is limited to the correct and professional use of the product according to the directives referred to herein and in the other supporting documents, and does not cover any damage (including but not limited to) the following causes:

- unspecified installation/use and, in particular, in contravention of the safety requirements of the legislation in force in the country of installation and/or specified in this document;
- use on equipment which does not provide adequate protection against electrocution, water and dust in the actual installation conditions;
- use on devices which allow access to dangerous parts without the aid of a keyed or tooled locking mechanism;
- tampering with and/or modification of the product;
- installation/use on equipment that does not comply with the regulations in force in the country of installation.

Disposal

The equipment (or product) must be subjected to separate waste collection in compliance with the local legislation on waste disposal.

Date of production

The date of production is shown on the device label, indicating the week and year of production (WW-YY).

1. INTRODUCTION

1.1. GENERAL DESCRIPTION

The **Coldface EWRC 300/500/5000 NT** series controls the temperature of a static or ventilated cold room. The instrument controls positive or negative cold rooms and is capable of managing a double evaporator and condenser fan.
Coldface has 3 or 5 configurable relays, depending on the model, and 2(3) configurable digital inputs for door switches or other devices. Models are available with clock with yearly calendar and HACCP event logging.
The instrument can be connected to Televis**System** / Modbus via the **RS-485 plug-in module** (optional).
The container lets you install one or more electromechanical devices, depending on the model.

1.2. MODELS

- **EWRC 300 NT** - Versions with 3 configurable relays for controlling al the accessory loads in the room.
- **EWRC 500 NT** - Versions with 5 configurable relays for controlling all the accessory loads in the room.
- **EWRC 500 NT HACCP** - Versions with 5 configurable relays for controlling all the accessory loads in the room, HACCP function with clock and yearly calendar.
- **EWRC 500 NT 4DIN** - Versions with 5 configurable relays for controlling all the accessory loads in the room, plus door for installation of magnetothermal switch or accessories on a DIN rail.
- **EWRC 500 NT 4DIN HACCP** - Versions with 5 configurable relays for controlling all the accessory loads in the room, HACCP function with clock and yearly calendar, plus door for installation of magnetothermal switch or accessories on a DIN rail.
- **EWRC 500 NT BREAKER** - Versions with 5 configurable relays for controlling all the accessory loads in the room, plus door and magnetothermal switch installed.
- **EWRC 500 NT 4DIN BREAKER HACCP** - Versions with 5 configurable relays for controlling all the accessory loads in the room, HACCP function with clock and yearly calendar, plus door and magnetothermal switch installed.
- **EWRC 5000 NT HACCP** - Version with larger container, with 5 configurable relays for controlling all the accessory loads in the room, HACCP function with clock and yearly calendar, plus door for installation of components on a DIN rail.

2. TECHNICAL SPECIFICATIONS

2.1. TECHNICAL DATA (EN 60730-2-9:2010, EN 61439-1:2011 / 61439-2:2011 / EN 60204-1:2006)

Front panel protection rating	IP65
Classification:	Electronic automatic control device (not safety device) for stand-alone installation
Installation:	wall
Type of action:	1.B
Pollution class:	2
Panel use:	Internal use
Panel type:	Fixed panel
Maximum installation site altitude:	2000 m (2187 yd)
Weight:	< 2 kg (< 4.41 lb)
Material class:	IIIa
Over-voltage category:	II
Nominal pulse voltage:	2500 Vac
Operating temperature:	-5…50°C (23°F...122°F) (EN 60730-2-9:2010)
Storage temperature:	-20…85°C (-20°F...185°F) -20…70 °C (-20 °F...158 °F) (1)
Operating humidity:	10…90% non-condensing
Storage humidity:	10…90% non-condensing
Power supply:	230 Vac ±10 % 50/60 Hz
Power consumption:	11 VA max
Magnetothermal switch:	**EWRC 500 BREAKER**: Two-pole (2P)
Control:	EWRC NT electronic controller
Connection:	device on external flexible cable, Y type connection
Digital outputs (relay):	refer to the label on the device
Fire resistance category:	D
Software class:	A
Ball test temperature:	100°C (212°F)
Clock backup: (HACCP models only)	Up to four days in the absence of an external power supply.

2.2. ELECTRICAL SPECIFICATIONS

Rated voltage (Un):	230 Vac
Rated operating voltage (Ue):	230 Vac
Rated insulation voltage (Ui):	230 Vac
Rated impulse withstand voltage (Uimp):	**EWRC 500 BREAKER** (1) : 4 kV (EN 61439-2:2011)
Rated panel current (InA):	**EWRC 500 BREAKER** (1): 16 A (EN 61439-2:2011)
Rated circuit current (InC):	**EWRC 500 BREAKER** (1): 16 A (EN 61439-2:2011)
Conditioned short circuit current (Icc):	< 4.5 kA
Rated frequency (fn):	50/60 Hz

(1) **EWRC 500 BREAKER RCA•••R•••••• / RCA•••S•••••• / RCNA•••R•••••• / RCNA•••S••••••**

2.3. FURTHER INFORMATION

2.3.1. INPUT CHARACTERISTICS

Measurement range:	NTC: -50.0...110°C (-58°F...230°F); (on 3-digit display with +/- sign) PTC: -55.0...150°C (-67°F...302°F); (on 3-digit display with +/- sign)
Accuracy:	better than 0.5% integral scale + 1 digit
Resolution:	0.1°C (0.1°F)
Buzzer:	only on models where this is provided
Analogue inputs:	3(2) configurable NTC/PTC inputs
Digital inputs:	2(3) multi-function, voltage-free digital inputs (DI)

2.3.2. OUTPUT CHARACTERISTICS

RELAY OUTPUTS

MODEL	EWRC 300 NT		EWRC 500/5000 NT		EWRC 500 NT	
CODE	**RCS•H••••••••** **RCNS•H••••••••**		**RCS•U••••••••** **RCA•U••••••••** **RCH300•••••••** **RCNS•U••••••••** **RCNA•U••••••••** **RCNH300•••••••**		**RCS•P••••••••** **RCA•P••••••••** **RCNS•P••••••••** **RCNA•P••••••••**

NOTE	Maximum common flow rate 16 A for models EWRC500 BREAKER: **RCA•••S•••••• / RCA•••R••••••** **RCNA•••S•••••• / RCNA•••R••••••** Maximum common flow rate 18 A for all other models					

2.3.3. MECHANICAL CHARACTERISTICS

Casing:	PC+ABS
Dimensions:	**EWRC 300/500** front panel 213 x 318 mm, depth 102 mm **EWRC 500 BREAKER** front panel 221 x 318 mm, depth 107 mm **EWRC 5000** front panel 420 x 360 mm, depth 147 mm
Terminals:	screw See “4.1.2. Rules for screw-type terminal boards” page 21
Connectors:	TTL for UNICARD / Copy Card / Device Manager connection (via DMI)
Humidity:	Operation / Storage: 10...90% RH (non-condensing)

NOTE: The technical specifications stated in this document regarding the measurement (range, accuracy, resolution, etc.) refer strictly to the instrument and not to any accessories provided, such as the probes.

3. MECHANICAL INSTALLATION

3.1. Before starting

Before starting to install your system, read this chapter carefully. Caution must be exercised concerning compliance with all safety information, other electrical requirements or laws which may apply to your machine or process when using this equipment.

⚠ WARNING

REGULATORY INCOMPATIBILITY

Make sure that all equipment used and the systems designed comply with all applicable local, regional and national laws.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

3.2. Disconnection from the power supply

⚠⚠ DANGER

HAZARD OF ELECTRIC SHOCK, EXPLOSION OR ARC FLASH

- Disconnect all power from all equipment including connected devices prior to removing any covers or doors, or installing or removing any accessories, hardware, cables or wires.
- Always use a properly rated voltage sensing device to confirm the power is off where and when indicated.
- Before powering the device back up, fit back and fix all the covers, hardware components and wiring.
- Check the earthing connections on all earthed devices.
- Use only the specified voltage when operating this equipment and any associated products.
- Comply with all standards regarding accident protection and local applicable safety directives.

Failure to follow these instructions will result in death or serious injury.

3.3. Operating environment

Flammable refrigerant gases

This equipment is designed to operate outside all hazardous locations and is not to be used in applications which generate (or could potentially generate) hazardous environments. Install this equipment only in areas and applications known to be free from dangerous atmospheres at all times.

⚠ DANGER

POTENTIAL FOR EXPLOSION

- Install and use this equipment in non-hazardous locations only.
- Do not install or use this equipment in applications which could generate hazardous atmospheres, such as applications which use flammable refrigerants.

Failure to follow these instructions will result in death or serious injury.

For information regarding the use of control equipment in applications capable of generating hazardous materials, please contact the relevant national regulatory bodies or certifying authorities.

⚠ WARNING

UNINTENDED EQUIPMENT OPERATION

Install and use the equipment in compliance with the conditions described in the Technical Specifications chapter.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

3.4. Comments concerning installation

⚠ WARNING

UNINTENDED EQUIPMENT OPERATION

- Use appropriate safety interlocks where personnel and/or equipment hazards exist.
- Do not use this equipment in safety-critical machine functions.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

The devices are designed for wall mounting.

When handling the equipment, use caution to avoid damage caused by electrostatic discharge. In particular, the unshielded connectors and in certain cases the open circuit boards are vulnerable to electrostatic discharge.

⚠ WARNING

UNINTENDED EQUIPMENT OPERATION DUE TO ELECTROSTATIC DISCHARGE

- Keep the equipment in the protective packaging until ready for installation.
- The equipment must only be installed in type-approved casing and/or in points that prevent unauthorised access and provide protection from electrostatic discharge.
- When handling sensitive equipment, use an antistatic bracelet or equivalent earthed protective device against electrostatic discharge.
- Before handling the equipment, always discharge the static electricity from the body by touching an earthed surface or type-approved antistatic mat.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

HACCP Module - RCN•••••••••• MODELS

NOTICE

INOPERABLE EQUIPMENT

For TTL serial line connection, use cables no longer than 1 m (3.28 ft).

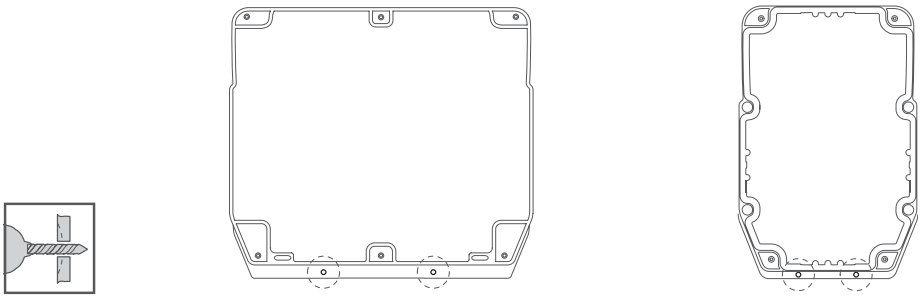
Failure to follow these instructions can result in equipment damage.

NOTE. For information on the cables to be used with the HACCP Module, contact your local Eliwell representative.

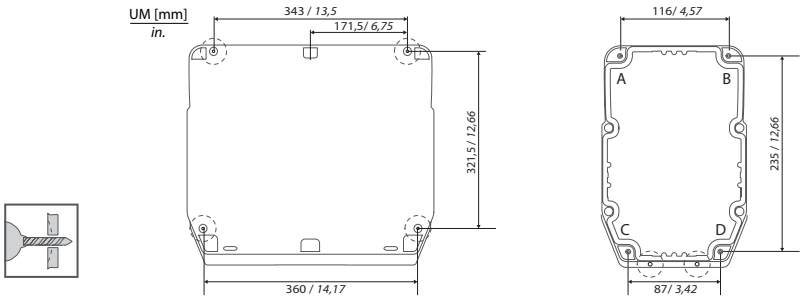
3.5. INSTALLATION PROCEDURE

NOTE: procedural steps that are common to all models. ONLY the EWRC 5000 model is used as an example.

1) Remove the cover and drill the holes for the cable clamps (at least one for power cables and one for signalling cables) on the bottom of the panel.
NOTE: for the 300/500 models, use the drilling template provided.



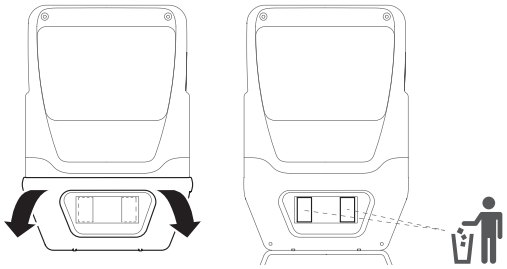
2) Drill the wall fixing holes on the back of the panel, in the areas marked on the back.



Hinges are available for mounting on special compartments for opening the cover both right and left.
Screw on the respective anchoring screws taking care that the hinges are fitted well and lie flush so that they do not interfere with the compression of the seal.

3) Optional. Fir the panel.

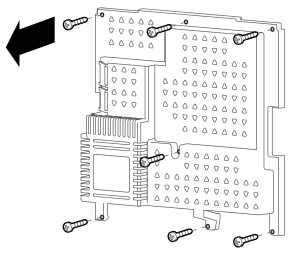
NOTE: on models 300/500 with front door two more DIN spaces can be created: open the door with both hands as shown in the figure, then remove the factory-fitted push-through tabs.

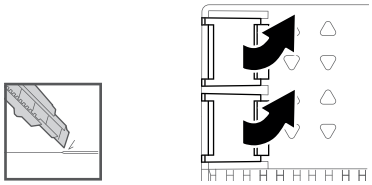


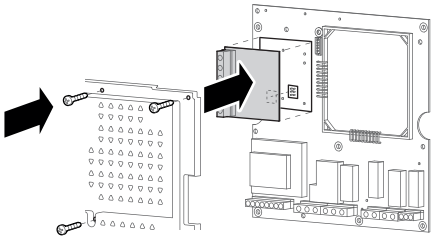
4) Optional. Install the plug-in RS-485 module for communication with the supervisor.

EWRC 5000 only:

1) Remove the seven screws securing the plastic protecting the board.
2) Remove the protective element, then use a box cutter to remove the two terminal covers.
3) Connect the RS-485 plug-in module (optional) using the specific spacers, then replace the cover and secure it using the screws.







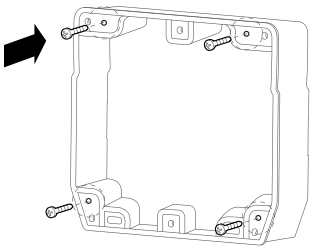
NOTICE

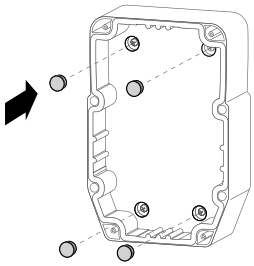
INOPERABLE DEVICE

Fit the plug-in RS-485 module in the plug-in connector aligning the four posts with the holes in the control board.

Failure to follow these instructions can result in equipment damage.

5) Fix the back of the panel to the wall using four screws (not supplied) suited to the wall thickness.
NOTE: TDI20 screw caps (not provided) can be fitted to 300/500 models at the wall mounting points so that the IP rating is not altered.





⚠⚠ DANGER

HAZARD OF ELECTRIC SHOCK, EXPLOSION OR ARC FLASH

For models with magnetothermal switch, before connecting make sure that switch is in the OFF position.

Failure to follow these instructions will result in death or serious injury.

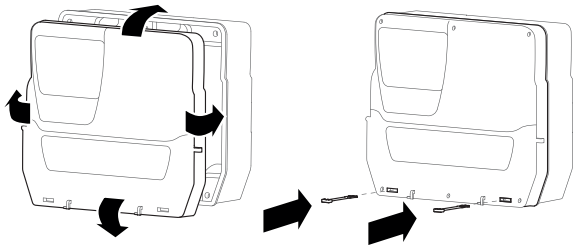
6) Make the electrical connections referring to the wiring diagrams shown page 23 and page 25. Use suitable cable/pipe clamps.

NOTE: only models with magnetothermal switch. Connect the switch to the electronic board power supply using the accessory cable provided in the packaging.

7) Hinges are available for mounting on special compartments for opening the cover both right and left.
Screw on the respective anchoring screws taking care that the hinges are fitted well and lie flush so that they do not interfere with the compression of the seal. Fit the hinges to secure the cover.

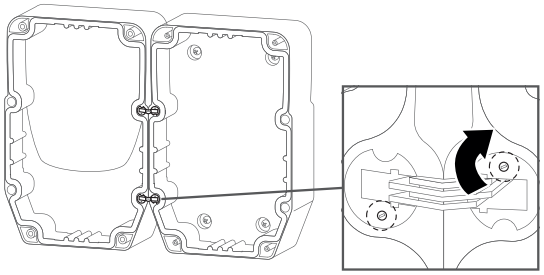
EWRC 5000

Place the panel cover on the base making it stick to the perimeter seal. Then, while holding the cover in place, fit the two hinges provided into the corresponding holes and press them until you hear them click as they are locked into place.

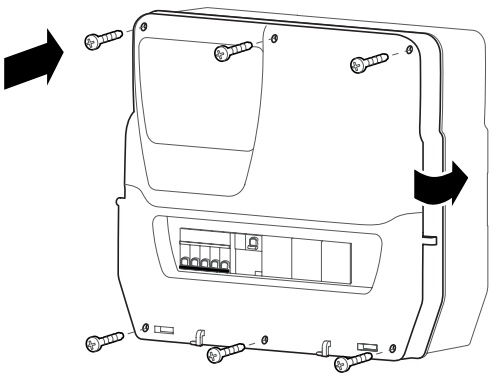


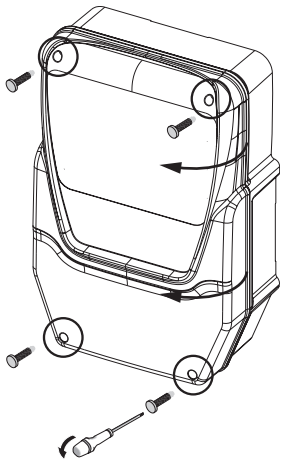
EWRC 300/500

Fit the hinges provided into their housings on the right or left side of the panel and tighten the corresponding screws to secure them.



8) Close the cover and secure it with the screws provided.





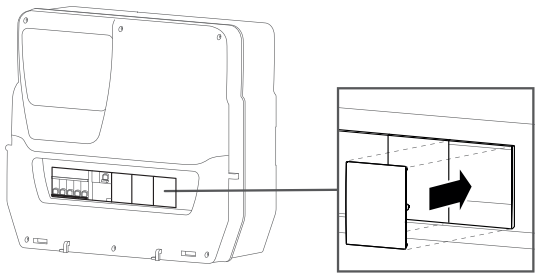
⚠⚠ DANGER

RISK OF ELECTRIC SHOCK, EXPLOSION OR EXPOSURE TO ACCESSIBLE PARTS

The final application must disallow access to parts at hazardous voltage, as the instrument offers no intrinsic protection against this risk.

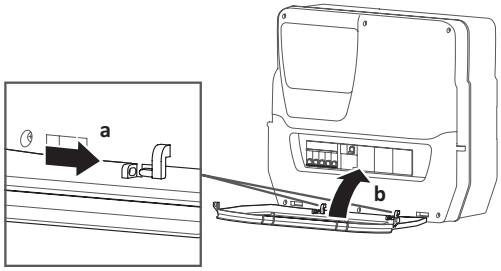
Failure to follow these instructions will result in death or serious injury.

9) DIN rail-mounted models with window only. Close access to inside the panel from the front window using the dedicated DIN plugs.
For EWRC NT 500 models with the plastic knockout removed and no internal magnetothermal switch, the end user is responsible for ensuring that the open parts of the box are not accessible.



10) EWRC 5000 only. Fit the door *(a)*: align the front door with the two hooks at the bottom of the panel and push it towards the right until you hear it click as it locks into place.

11) Close the door *(b)*



⚠ WARNING

UNINTENDED EQUIPMENT OPERATION

- Place the devices dissipating the most heat in the top of the cabinet and ensure suitable ventilation.
- Do not place this equipment near or above any devices which could cause overheating.
- Install the device in a point that guarantees the minimum distances from all structures and adjacent equipment as indicated in this document.
- Install all equipment in conformity with the technical specifications given in the respective documentation.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

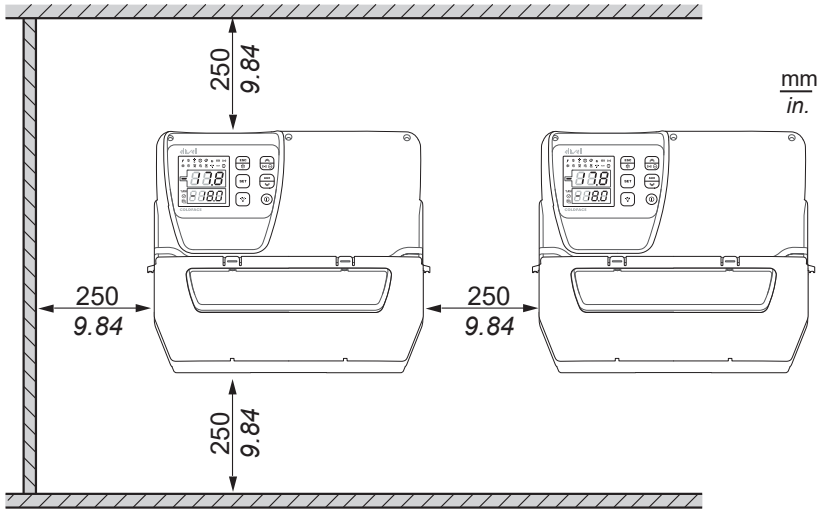


Fig. 1. Distance valid for all models

4. ELECTRICAL CONNECTIONS

4.1. Wiring practices

The following information describes the guidelines for wiring and the associated best practices to follow when using the device.

⚠⚠ DANGER

HAZARD OF ELECTRIC SHOCK, EXPLOSION OR ARC FLASH

- Disconnect all power from all equipment including connected devices prior to removing any covers or doors, or installing or removing any accessories, hardware, cables or wires.
- Always use a properly rated voltage sensing device to confirm the power is off where and when indicated.
- Before powering the device back up, fit back and fix all the covers, hardware components and wiring.
- Check the earthing connections on all earthed devices.
- Use only the specified voltage when operating this equipment and any associated products.
- Comply with all standards regarding accident protection and local applicable safety directives.

Failure to follow these instructions will result in death or serious injury.

⚠⚠ DANGER

HAZARD OF OVERHEATING AND/OR FIRE

- Do not use with loads other than those indicated in the technical specification.
- Do not exceed the maximum permitted current; for higher loads, use a meter with sufficient power capacity.

Failure to follow these instructions will result in death or serious injury.

This equipment is designed to operate outside all hazardous locations and is not to be used in applications which generate (or could potentially generate) hazardous environments. Install this equipment only in areas and applications known to be free from dangerous atmospheres at all times.

⚠ DANGER

POTENTIAL FOR EXPLOSION

- Install and use this equipment in non-hazardous locations only.
- Do not install or use this equipment in applications which could generate hazardous atmospheres, such as applications which use flammable refrigerants.

Failure to follow these instructions will result in death or serious injury.

For information regarding the use of control equipment in applications capable of generating hazardous materials, please contact the relevant national regulatory bodies or certifying authorities.

4.1.1. Wiring guidelines

The following regulations must be complied with for wiring:

- Make connections as short as possible and do not wind them around electrically connected parts.
- Check that the operating conditions and surroundings comply with the specification values.
- Use wires of the correct diameter and suited to the voltage and current requirements.
- Use copper conductors (obligatory).

⚠ WARNING

UNINTENDED EQUIPMENT OPERATION

- The equipment signal cables (probes, digital inputs, communication, and the relative power supplies) must be laid separately from the power cables.
- Every end application of this device must be tested individually and completely in order to check its proper operation before putting it in service.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

HACCP Module - RCN•••••••••• MODELS

NOTICE

INOPERABLE EQUIPMENT

For TTL serial line connection, use cables no longer than 1 m (3.28 ft).

Failure to follow these instructions can result in equipment damage.

NOTE. For information on the cables to be used with the HACCP Module, contact your local Eliwell representative.

4.1.2. Rules for screw-type terminal boards

The table below illustrates the types of cables and wire sections for a screw-type terminal board with **5.08 (0.197 in.)** spacing:

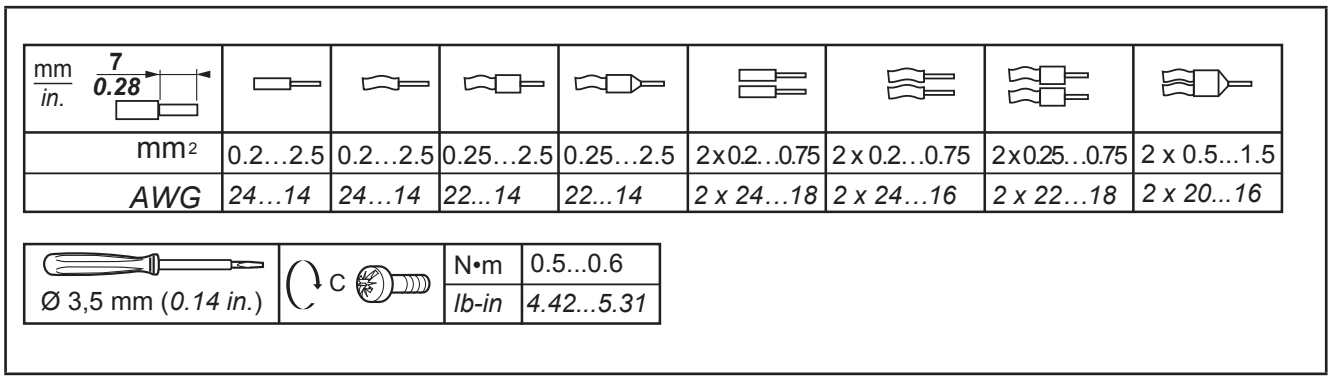

Fig. 2. Spacing 5.08 mm (0.197 in.)

The table below illustrates the types of cables and wire sections for a screw-type terminal board with **7.62 (0.30 in.)** spacing:

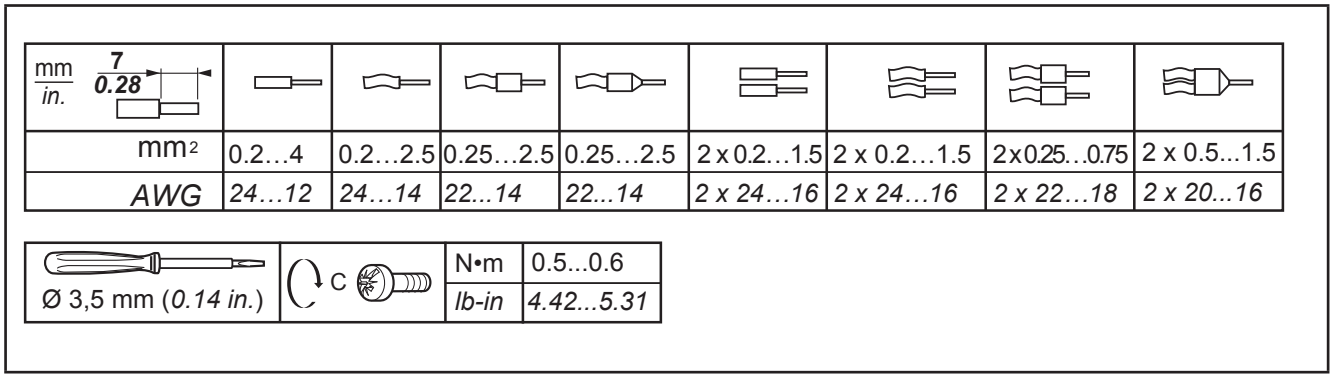

Fig. 3. Spacing 7.62 mm (0.3 in.)

The table below illustrates the types of cables and wire sections for the magnetothermal switch:

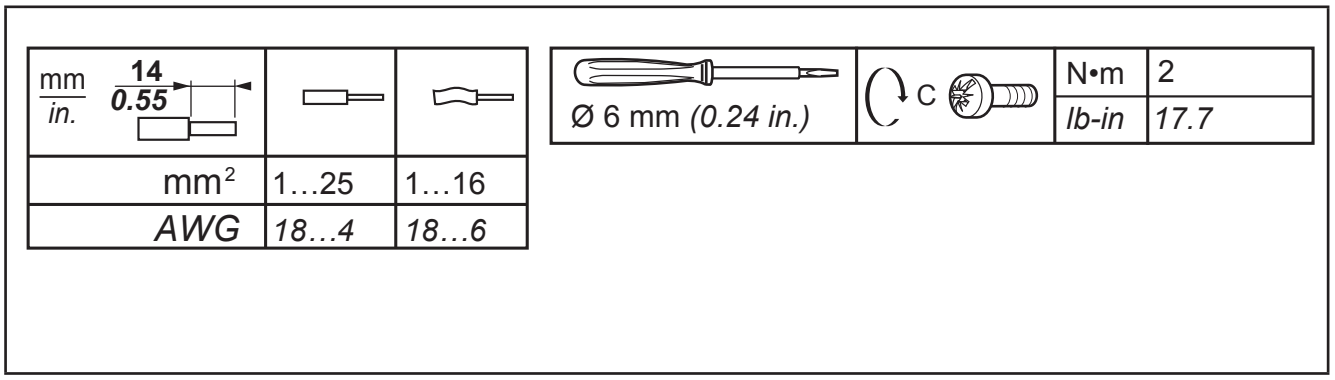

Fig. 4. Cable types and tightening torque for the magnetothermal switch

⚠ ⚠ DANGER

LOOSE WIRING CAN RESULT IN ELECTRIC SHOCK

Tighten the connections in compliance with the technical specifications for pairs.

Failure to follow these instructions will result in death or serious injury.

Specific considerations for handling

When handling the equipment, use caution to avoid damage caused by electrostatic discharge. In particular, the unshielded connectors and in certain cases the open circuit boards are vulnerable to electrostatic discharge.

⚠ WARNING

UNINTENDED EQUIPMENT OPERATION DUE TO ELECTROSTATIC DISCHARGE

- Keep the equipment in the protective packaging until ready for installation.
- The equipment must only be installed in type-approved casing and/or in points that prevent unauthorised access and provide protection from electrostatic discharge.
- When handling sensitive equipment, use an antistatic bracelet or equivalent earthed protective device against electrostatic discharge.
- Before handling the equipment, always discharge the static electricity from the body by touching an earthed surface or type-approved antistatic mat.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

4.1.3. Analogue Inputs-Probes

⚠ WARNING

UNINTENDED EQUIPMENT OPERATION DUE TO CONNECTIONS

- The equipment signal cables (probes, digital inputs, communication, and the relative power supplies) must be laid separately from the power cables.

Failure to follow these instructions can result in death, serious injury, or equipment damage.

NOTICE

INOPERABLE DEVICE

Before switching on the electrical power, check all the wiring connections.

Failure to follow these instructions can result in equipment damage.

NOTE: The NTC temperature probes do not feature any connection polarity and can be extended using normal bipolar cable.

4.1.4. Serial connections

The controller can be connected to Televis**System** / Modbus remote control systems by a direct RS-485 connection using the RS-485 optional plug-in module.

4.1.5. RS-485 connection

- Use a "**twisted pair**" shielded cable with two conductors with cross-section 0.5 mm^2 (AWG 20), plus sheath, such as, for example, a Belden cable version 3105A (typical impedance 120 Ω) with PVC sheath, rated capacity between conductors 36 pF/m, rated capacity between conductor and sheath 68 pF/m. Alternatively, use a "**twisted pair**" shielded cable with two conductors with cross-section 0.5 mm^2 (AWG 20), plus sheath, such as, for example, a Belden cable version 8762 with PVC sheath, rated capacity between conductors 89 pF/m, rated capacity between conductor and sheath 161 pF/m. For laying wires, comply with the indications given in standard EN 50174 on information technology wiring.
- Follow the applicable regulations for laying and connecting the cables. Extra care must be taken in separating data transmission circuits from power lines.
- The length of the RS-485 network which can be connected directly to the controller is 1200 m. This length can be extended and the number of devices for each channel increased using appropriate repeater modules.
- Input impedance: 1/8 unit load.
- Single terminal board with 3 conductors: use all 3 conductors ("+" and "-" for the signal and "GND" for the braiding).
- Attach the 120 Ω 1/4W resistors between the "+" and "-" terminals on the interface and the last controller in each branch of the network.
- The RS-485 physical level can be used for Modbus SL communication
  Concurrent communication of different protocols on the same serial port is **NOT** permitted.

Pay special attention when connecting serial lines. Incorrect wiring may cause the equipment to stop working.

NOTICE

INOPERABLE DEVICE
Do not communicate simultaneously via Modbus and Televis protocols on the same serial port.
Failure to follow these instructions can result in equipment damage.

4.1.6. TTL connection

Use a 5-wire TTL cable up to 3 m (118 in.) in length.
An Eliwell-supplied TTL cable is recommended. Contact Eliwell Sales Office for item availability.

HACCP Module - RCN••••••••• MODELS

NOTICE

INOPERABLE EQUIPMENT
For TTL serial line connection, use cables no longer than 1 m (3.28 ft).
Failure to follow these instructions can result in equipment damage.

NOTE. For information on the cables to be used with the HACCP Module, contact your local Eliwell representative.

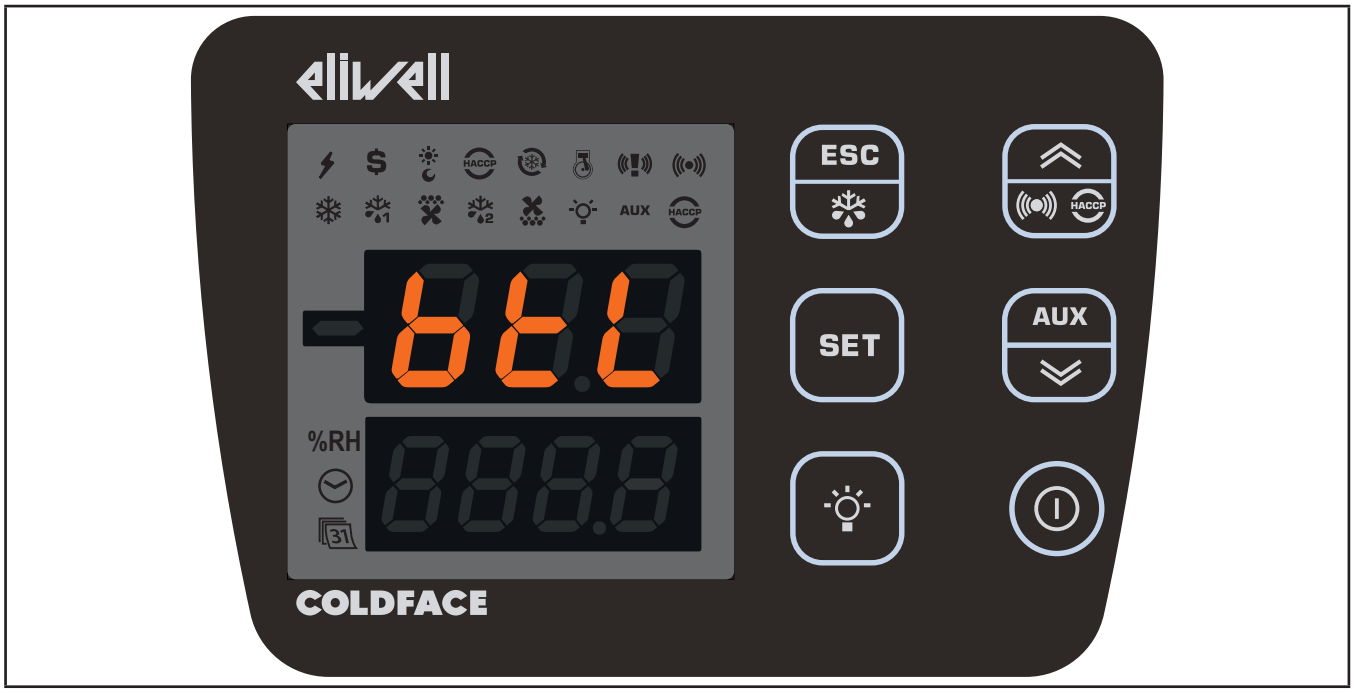
No.	KEY	press and release	press and hold for about 3 seconds	NAVIGATION MENU	Notes
A	ESC Defrost	• Functions Menu	• Manual defrost • Return to Main Menu	• Output	Configurable - see parameter H33
B	▲ UP Alarms	• Alarms Menu (always visible)	/	• Scroll • Increase values	HACCP alarms only on foreseen models and if present
C	SET	• Display setpoint / probe values / time (Models with clock only) • Confirm values • Access value edit mode (top display blinking)	Access Parameters menu	• Confirm values • Move right	Time only visible on models with clock
D	▼ DOWN AUX	system INFO See Technical Support	Activate auxiliary function	• Scroll • Decrease values	Configurable - see parameter H32
E	ON/OFF	/	Switch On/Off device	/	Configurable - see parameter H34
F	LIGHT	Switch light On/Off	Switch light On/Off	/	Configurable - see parameter H35

5.1.2. DISPLAY MEANING

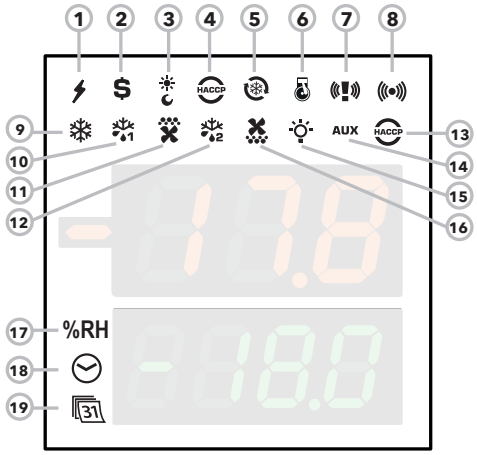
G	H
3-FIGURE TOP DISPLAY plus the - sign	**4-FIGURE BOTTOM DISPLAY**
Display: • operating value • parameters label • alarms, functions if TOP display is **blinking** it means that the value of the BOTTOM Display can be modified	Display: • parameters value • probe value • function state **HACCP models** • time

5.1.3. CONNECTION TO HACCP Module



RCN•••••••••• models: when the HACCP Module is connected and the Bluetooth connection to the Eliwell Air App is active, the btL label appears on the TOP DISPLAY and the BOTTOM DISPLAY and icons are turned off.

5.1.4. ICONS



Icons have the following meaning:

No.	ICON	colour	description
17	%RH	amber	not used
18	TIME	amber	access in case of time display or editing
19	DATA	amber	access in case of date display or editing

Alarms	ICON 7	ICON 8	Colour	Buzzer	OFF	
					Icon	Buzzer
ALARM			Red	See “8.2. ALARM CAUSE/EFFECT TABLE” page 81		
PANIC			Red		---	---
LEAK DETECTOR			Red			---
PANIC + LEAK DETECTOR			Red		---	(1)

(1) = As long as the Panic alarm persists it will not be possible to mute the buzzer from the keypad.

No.	Icon	colour	ON	BLINKING	OFF
1	POWER SUPPLY	green	Power supply ON	/	Power supply OFF
2	ENERGY SAVING	amber	Energy saving ON	/	Energy saving OFF
3	NIGHT & DAY	amber	Night & Day ON	/	Night & Day OFF
4	HACCP	amber	HACCP menu	/	/
5	DEEP COOLING (DCC)	amber	Drip cooling cycle ON	/	Drip cooling cycle OFF
6	PUMP DOWN	amber	Compressor Pump Down ON	/	Compressor Pump Down OFF
9	COMPRESSOR	amber	Compressor ON	Delay	Compressor OFF
10	DEFROST 1	amber	Defrost	Dripping	No defrost
11	EVAPORATOR FANS	amber	Fans ON	Forced ventilation	Fans OFF
12	DEFROST 2	amber	Defrost	Dripping	No defrost
13	HACCP ALARM	red	HACCP alarm	Not displayed	No alarm
14	AUXILIARY (AUX)	amber	AUX ON	/	AUX OFF
15	LIGHT	amber	Light ON	/	Light OFF
16	CONDENSER FANS	amber	Fans ON	/	Fans OFF
ON: function/alarm ON; OFF: function/alarm OFF					

5.1.5. PRELIMINARY CONFIGURATIONS

After making the electrical connections, simply power up the device to start operation.
At first start-up, Eliwell recommends that you:

1. make sure the instrument is powered (green POWER SUPPLY icon on)
2. make sure the display is working: when the controller is powered up it performs a lamp test, during which time the display and icons will blink for several seconds to ensure that they all function correctly
3. make sure there are no active alarms (ALARM / HACCP ALARM icon off and labels **E1**, **E2**, **E3** not displayed).
4. configure the main parameters listed in the USER menu to suit your requirements, as described below

5.1.6. OPERATION IN DEFAULT CONFIGURATION

The instrument is configured for negative cold. For positive cold, disable the evaporator probe Pb2 (set **H42**=n) and relay OUT3 (set **H23**=6) to prevent continuous ventilation.

COMPRESSOR
The compressor is active if the cold room temperature measured by Pb1 exceeds the value of SEt + **diF**. The compressor stops if the cold room temperature detected by Pb1 falls below the SEt value. The instrument includes compressor on/off protection.

DEFROST
Defrost is by means of electric heaters (parameter **dty** = 0) and the time counter is always active with the instrument switched on (**dCt**=1).

Manual defrost
Manual defrost is activated by pressing and holding the ESC key (A)
If conditions are not right for defrosting, (e.g. the evaporator probe temperature is higher than the defrosting end temperature) or parameter **OdO**≠0, the display will blink three times to indicate that the operation will not be performed.

Default Defrost settings
dit = 6 hours. interval between 2 defrost cycles
dSt = 6.0 °C. defrosting end temperature. set by Pb2
The Defrost cycle may terminate due to a timeout based on the parameter **dEt** (default 30 min).

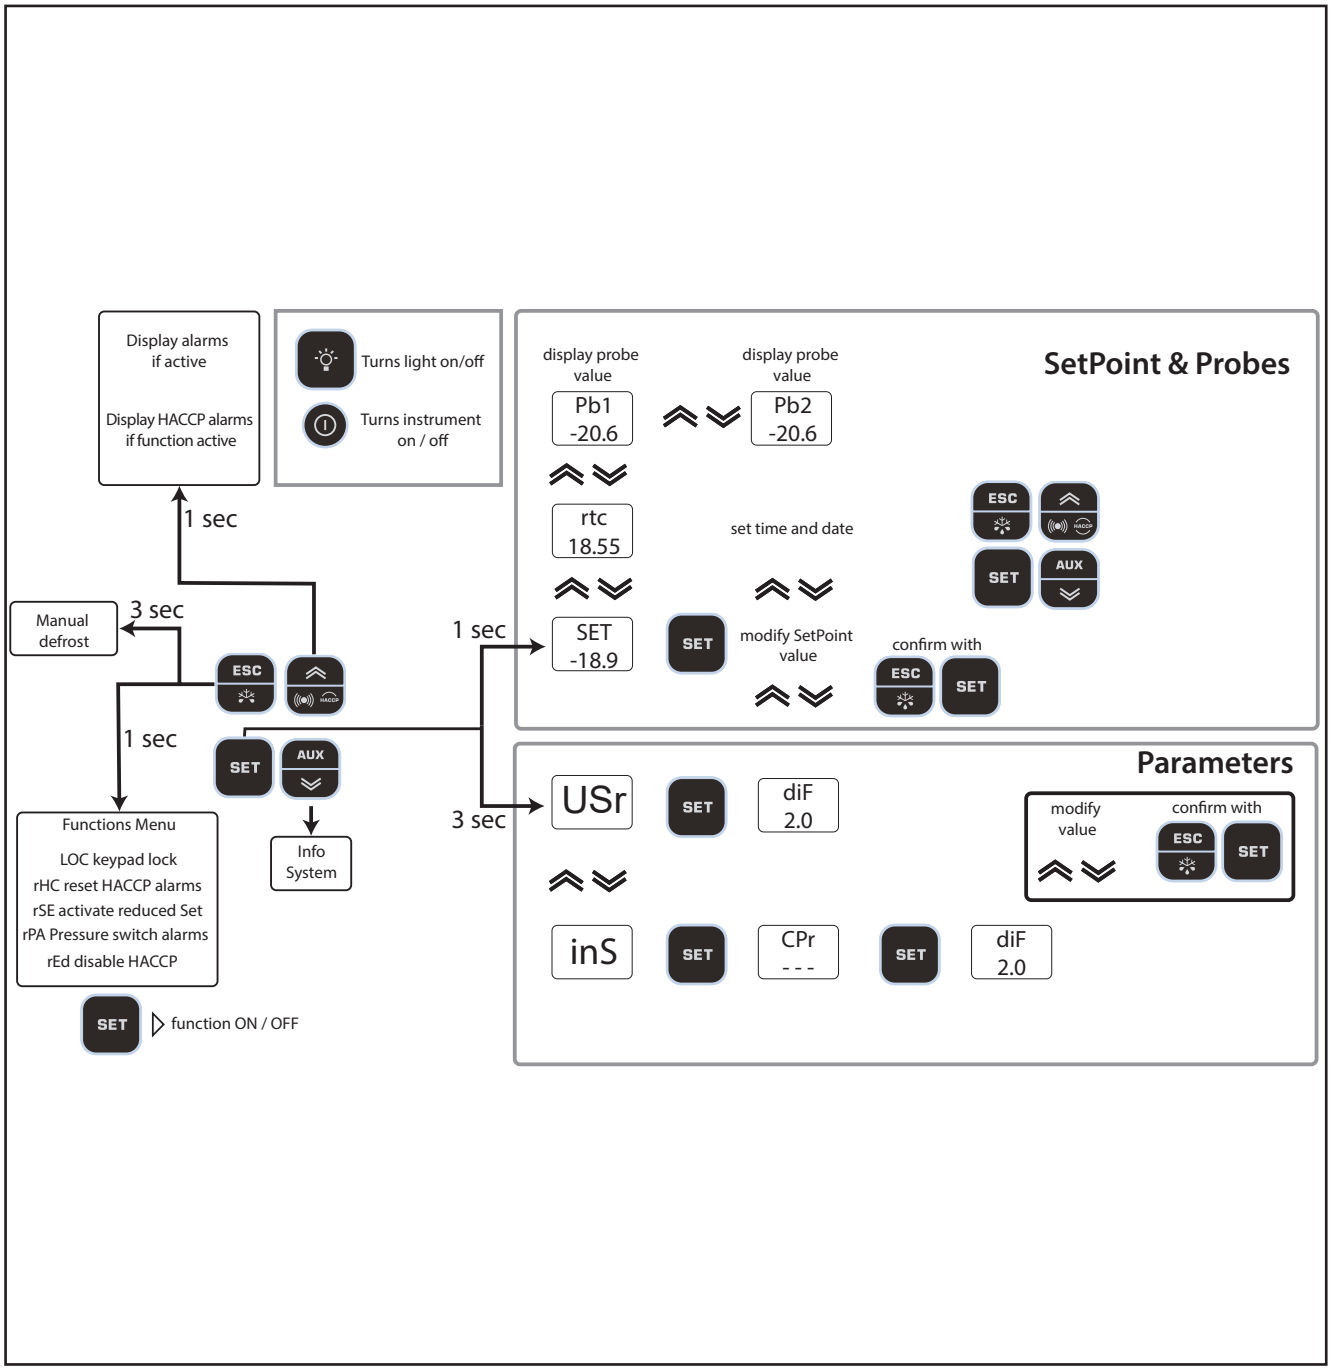
EVAPORATOR FANS
The OUT3 relay is configured as the fan relay and is activated when required, according to the delay and parameter settings.

Default fan settings
dt = 0 min. dripping time
dFd = Y. Fans off during defrosting

LIGHT (EWRC 500/5000)
The light is activated by pressing and holding the LIGHT key (F)
As digital input DI1 is configured as door switch, relay OUT4 (light) is activated when the door is opened. The light also switches on with the instrument in stand-by.

ALARM relay (EWRC 500/5000)
Relay OUT5 is configured as alarm relay and is activated in the case of alarms, according to delays and parameter settings.

5.1.7. NAVIGATION



5.1.8. FUNCTIONS MENU AND KEY-ENABLED FUNCTIONS

The Functions menu is used to perform a number of manual functions such as putting the device into stand-by, clearing pressure switch interventions and clearing HACCP alarms, etc.

Access the Functions menu by pressing the ESC key.

The following table lists the functions, which are all OFF by default.

Display	Function	description
	Keypad lock	The UP/ESC/ON-OFF/LIGHT keys and the functions programmed via keys are locked The DOWN key may be used to view the Setpoint only; the value cannot be modified Only function visible if keypad locked (On)
	Disables HACCP alarm recording	Disables HACCP alarm recording
	Reset pressure switch alarm	Clears pressure switch alarm NOTE: the function reverts to OFF status when you exit the Functions Menu
	Reduced set	Reduced set
	Reset HACCP alarms	Clears HACCP alarms May be protected by Password PA3

All models have the **UP** key set to display the Alarms Menu.
All models also allow the setting of other keys to activate a specific function as identified by the client.
The parameters for configuring the two keys are:

- **H32** = DOWN key configuration
- **H33** = ESC key configuration
- **H34** = ON/OFF key configuration
- **H35** = LIGHT key configuration

The values that can be set apply to these keys and the functions that can be activated are:

Value of H32/H33/H34/H35	
0 = disabled	10 = Activate / disable Frame Heater relay
1 = defrost	11 = Enable/disable Night And Day functions
2 = Auxiliary	12 = deep cooling cycle
3 = Activate reduced set	13 = Clear voltage drop errors (Reset Power Failure)
4 = Reset HACCP alarms	14 = Service stoppage
5 = Disable HACCP alarms	15 = Activate economy set + Night And Day
6 = Light	
7 = Stand-by	
8 = NOT USED	
9 = Evaporator fans ON	

5.1.9. PASSWORDS

Password PA1 is disabled by default.

Password "**PA1**": allows access to **User** parameters.

To enable (**PA1≠0**): press and hold **SET** for more than 3 seconds. The label **USr** appears. Press **SET** again.
Scroll through the parameters using **UP** and **DOWN** until you find label **PA1**, press **SET** to display its value, change it using **UP** and **DOWN** and save by pressing **SET** or **ESC.**

Example with password enabled (**PA1≠0**): it will be requested before access to the User parameters is granted.

Display	description
	Press SET for 3 seconds
	Label PA1 appears
	Press SET Use UP and DOWN keys to enter the password
	In the example the password is 12 Press SET
	User menu accessed The first User parameter appears If the value entered is incorrect, label **PA1** will be shown again and the procedure must be repeated

Password "**PA2**": allows access to **Installer** parameters.

The example is the same. Note. Password **PA2** is set by default to **15**

Display	description
	Press SET for 3 seconds
	Label USr appears Use 'UP' and 'DOWN' to search for InS

Display	description
	Press SET
	Use UP and DOWN keys to enter the password
	In the example the password is 15 Press SET
	Installer menu accessed the first CPr folder appears If the value entered is incorrect, label **PA2** will be shown again and the procedure must be repeated

5.1.10. SETPOINT PROGRAMMING

By way of example, we will change the Setpoint value from -18.0 degrees centigrade to -20.0 degrees centigrade.

Display	description
	Press and release the SET key
	The top display will show SEt, the bottom display will indicate the current setpoint value Press and release the SET key once more
	The top display will show SEt blinking Use the UP & DOWN keys to adjust the setpoint value
	Press the ESC key several times to return to the normal display (or press the SET key to confirm, followed by ESC to exit) The new Setpoint value is saved and appears on the bottom display

5.1.11. VIEWING PROBE VALUES

Display	description
	Press and release the SET key
	The top display will show SEt, the bottom display will indicate the current setpoint value Use the DOWN key to view the value of probe Pb1
	The time is displayed in HACCP models
	Use the DOWN key again to view the value of probe Pb1
	Use the DOWN key again to view the value of probe Pb2
	If H43 is not 0 (probe 3 present) Use the DOWN key again to view the value of probe Pb3
	Press the ESC key to return to the normal display Normal display

5.1.12. How to modify the date and time

Function only available in HACCP models

Display	description
	Press and release the SET key
	The top display will show SEt, the bottom display will indicate the current setpoint value Use the DOWN key to display the time
	**The CLOCK icon will be on** Press and release the SET key.
	**The CLOCK icon will be on** <u>The hour value will begin to blink</u> Use the UP & DOWN keys to adjust the hour value
	**The CLOCK icon will be on** Press and release the SET key
	**The CLOCK icon will be on** The hour value has been changed <u>The minute value begins to blink</u> Use the UP & DOWN keys to adjust the hour value
 	Repeat this procedure to adjust the date value (DAY.MONTH) and YEAR In this case the DATA icon (31) is on Press the ESC key several times to return to the normal display

5.1.13. Displaying Alarms

Display	description
	Press and release the UP key. The top display will show ALr.
 	The bottom display will show a. nOnE if no alarms active b. SYSt if system alarms present
	**HACCP models ONLY** The top display will show ALr. The bottom display will show HACP if HACCP alarms are present NOTE: parameter H50 must = 1

5.1.14. System Alarms example

Let us suppose two alarms have occurred,
- one HIGH TEMPERATURE on the cold room probe
- one HIGH TEMPERATURE on probe 3 (parameter H43 different from 0)

Display	description
	Press and release the UP key.
	The top display will show ALr. The bottom display will indicate SYSt Press and release the SET key.
	The top display will show ALr. The bottom display will show HA1 HIGH TEMPERATURE alarm on the cold room probe Use the UP & DOWN keys to view other alarms, if present
	In the example, the bottom display will indicate HA3 HIGH TEMPERATURE alarm on probe 3 (see para. H43) Press the ESC key several times to return to the normal display

5.1.15. Modifying a parameter

The User parameters **USr** are not divided into subfolders.
They are always visible by default (access password PA1 is not enabled by default).
The same parameters are also visible in the respective folders 'Compressor', 'Fans', etc. within the Installer parameters menu **InS**. The password is enabled (PA2=15) by default.

NOTE: It is advisable to switch the device off and on again each time the configuration of the parameters is changed, so as to prevent malfunctions affecting the configuration and/or the current timings.

How to modify a user parameter

Instructions are provided below on how to modify a User parameter
The same procedure applies to Installer (**inS**) level parameters.
Let us take the **dit** parameter as our example.
There are no sub-folders at User level. At Installer level the parameter is in the folder containing **dEF** defrost parameters.
We will now show how to change the value from 6 hours to 8 hours.

Display	description
	Press and hold the SET key for approx. 3 seconds
	The folder for USr parameters will appear Press and release the SET key. Press and release the SET key to access the first parameter
	The first User parameter appears Use the UP & DOWN keys to find the parameter that you wish to modify
	Press and release the SET key. The dit label will blink Use the UP & DOWN keys to adjust its value
	Press and release the SET key to confirm the modification.

How to modify an Installer parameter

Instructions are provided below on how to modify the same User parameter but via the Installer menu
Let us take the **dit** parameter as our example.
At Installer level the parameter is in the folder containing **dEF** defrost parameters.
We will now show how to change the value from **8 h to 6 h.**

Display	description
	Press and hold the SET key for approx. 3 seconds
 	The folder for USr parameters will appear Use the UP & DOWN keys to search for the inS folder Press and release the SET key. Press and release the SET key to access the first parameter
   	The first folder appears Use the UP & DOWN keys to search for the dEF folder
 	Press and release the SET key. The first parameter in the dEF folder will appear Use the UP & DOWN keys to find the parameter you want to change
 	Press and release the SET key. The dit label will blink Use the UP & DOWN keys to adjust its value Press and release the SET key to confirm the modification.

6. FUNCTIONS AND REGULATORS

This chapter describes the various functions of the devices.

NOTE: some functions may not be available in certain models.

6.1. SETTINGS

6.1.1. PROBE SETTING AND CALIBRATION

EWRC 300/500/5000 NT have 3 configurable NTC/PTC inputs (Pb1...Pb3).

The temperature probes (Pb1...Pb3) must all be the same type and should be configured via parameter **H00,** visible at User level (**USr**) or inside folder **CnF**, Installer level (**inS**)

- **H00** = 0 if using PTC probes
- **H00** = 1 if using NTC probes (Default)

After installation, the values read by the probes can be corrected/calibrated using the following parameters:

- **CA1**: probe 1 offset. Positive or negative value to be added to the value read by Pb1 (Range: **-30.0...30.0**)
- **CA2**: probe 2 offset. Positive or negative value to be added to the value read by Pb2 (Range: **-30.0...30.0**)
- **CA3**: probe 3 offset. Positive or negative value to be added to the value read by Pb3 (Range: **-30.0...30.0**)

6.1.2. DISPLAY SETTINGS

At User level (**Usr**) or inside the **diS** folder at Installer level (**inS**) you will find the parameters used to set the temperature readout, decimal point usage, unit of measure and display during defrost.

- **ndt**: (**USr/inS**) enables/disables decimal point display
  (with resolution of one-tenth of a degree; e.g.: 10.0°C)
  Display with decimal point is only possible within the range of values from -99.9°C to 99.9°C
  - ndt = y ➔ displays read values with decimal point **(default)**;
  - ndt = n ➔ displays read values without decimal point

  NOTE: enabling/disabling the decimal point only affects the on-screen display of values. The controller will continue to perform calculations with decimal point.

- **ddL**: (**USr/inS**) sets the type of display during and up to the end of defrost
  - ddL = 0 ➔ displays the probe value **(default)**
  - ddL = 1 ➔ continues to display the value read by the probe at the start of defrosting
  - ddL = 2 ➔ displays the fixed label **dEF**

- **dro**: (**inS**) sets temperature display to °C or °F.
  - dro = 0 ➔ display in °C **(default)**
  - dro = 1 ➔ display in °F

  NOTE: switching between °C and °F DOES NOT modify the values of temperature parameters (e.g. setpoint=10°C becomes 10°F).
  This means that the maximum and minimum limits of parameters as absolute values are the same for both units of measure and hence the ranges are different.

- **ddd**: (**inS**) establishes the value to be shown on the top display.
  All other display and adjustment modes are the same.
  - ddd = Set ➔ displays the Setpoint value
  - ddd = Pb1 ➔ displays the values read by Pb1 **(default)**
  - ddd = Pb2 ➔ displays the values read by Pb2
  - ddd = Pb3 ➔ displays the values read by Pb3

6.2. FUNCTIONS

6.2.1. UPLOAD, DOWNLOAD, FORMAT

Description

The UNICARD / Copy Card must be connected to the (TTL serial port and allows the rapid programming of instrument parameters.

DOWNLOAD from reset operating mode: at power-on, if the UNICARD / Copy Card is inserted in the device, the controller automatically downloads data.

After connecting the UNICARD / Copy Card with the instrument switched off and on completion of the lamp test, one of the following labels will be displayed:

- **dLY** if the operation was successful
- **dLn** if the operation was not successful

After about 5 seconds, the display will show the probe or set point value, depending on the default settings.

NOTE: once the download has been completed successfully, the controller will start to work with the new map loaded.

Operating mode: access “Installer” parameters by entering the password “**PA2**” if enabled (PA2≠0), scroll through the folders using **UP & DOWN** until the folder “**FPr**” appears. Select it using **SET**, scroll through the parameters using **UP & DOWN** and then select one of the functions by pressing **SET**:

- **UL** (Upload): With this function, the programming parameters are uploaded from the instrument to the card. If the operation is successful, the display will show “**y**”, otherwise it will show “**n**”.
- **Fr** (Format): This command is used to format the copy card (which is necessary when using the card for the first time).
  NOTE: the use of the **Fr** parameter deletes all data present and this operation cannot be reversed.
- **Download**: Connect the UNICARD / Copy Card when the instrument is switched off. At power-on, data will automatically start downloading from the UNICARD / Copy Card to the instrument. At the end of the lamp test, the display will show “**dLy**” if the operation was successful and “**dLn**” if not.

NOTE: before Uploading or Downloading a map, make sure that communication
with the supervisor (PC with Televis, TelevisGo system, etc.) has been cut off.
This means you should make sure that the RS-485 is disconnected from the instrument or that Supervision system acquisitions have been stopped.

Parameters

The parameters that control this function are:

Label	Description
UL	Transfer of programming parameters from device to UNICARD / Copy Card **COLDFACE ➔ UNICARD / Copy Card**
dL	Transfer of programming parameters from UNICARD / Copy Card to device **UNICARD / Copy Card ➔ COLDFACE**
Fr	UNICARD / Copy Card formatting. Erases all data on the UNICARD/UNICARD / Copy Card

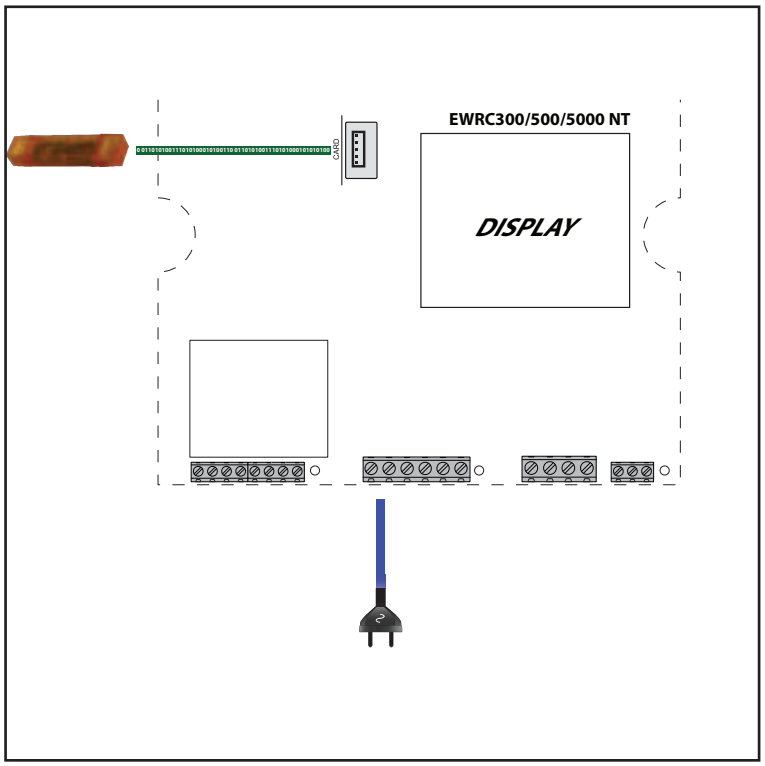
6.2.2. UNICARD

The Unicard lets you download/upload a parameter map from/to a controller, in the same way as the UNICARD / Copy Card.
It is a versatile tool that also allows you to quickly and easily customise devices.
It differs from the UNICARD / Copy Card in the following ways:

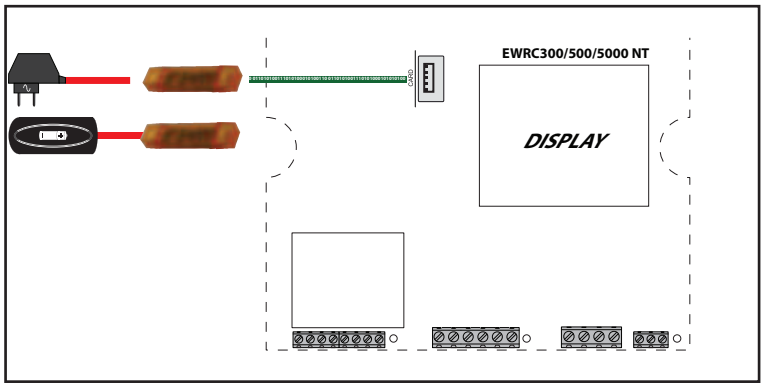
1) it can be connected to a computer via USB
2) it can be plugged into a USB socket or USB battery, to power the device directly during upload/download.

The UNICARD can be powered in the following ways:

A) Cabinet powered



B) Site powered



6.3. BOOT LOADER FIRMWARE

The device is equipped with a Boot Loader, so it is possible to update the Firmware directly on site.
Updating may be carried out using UNICARD or UNICARD / Copy Card (UNICARD / Copy Card).

Updating procedure:

- Connect the UNICARD/UNICARD / Copy Card equipped with the application;
- Power the device if it is off, otherwise switch it off and on again

  NOTE: the UNICARD/UNICARD / Copy Card can be connected even with the instrument powered.

- Wait until the LED for the UNICARD/UNICARD / Copy Card is blinking (operation in progress);
- The operation will be concluded when the LED for the UNICARD/UNICARD / Copy Card is:
  - **ON**: operation concluded correctly;
  - **OFF**: operation not performed (application not compatible...)

NOTE: the LED display is only provided for UNICARDS produced from week 18-12 onwards.

6.4. COMPRESSOR

The compressor is controlled by the device's relay. It will be switched on or off depending on:

- the temperature status readings from the cold room probe
- the temperature control functions set
- the defrost/dripping functions (see Defrost chapter)

6.4.1. Compressor configuration

See the wiring diagrams for details of how to connect the compressor to the device
Relay polarity is fixed.

NOTE: you MUST check the Compressor ➔ digital output (relay) association by setting parameter **H2x** accordingly.
NOTE: By default **H21 = 1 (compressor)**

6.4.2. Second compressor configuration

Coldface offers the option of using a second compressor
NOTE: you MUST check the Compressor 2 ➔ digital output (relay) association by setting parameter **H2x** accordingly.
Example **H25 = 10 (compressor 2).**
NOTE: to prevent the two compressors from starting up with an insufficient interval in between, an activation delay can be set for the second compressor using **dSC**.

6.4.3. Compressor operating conditions

Compressor operation
The regulator is active when:

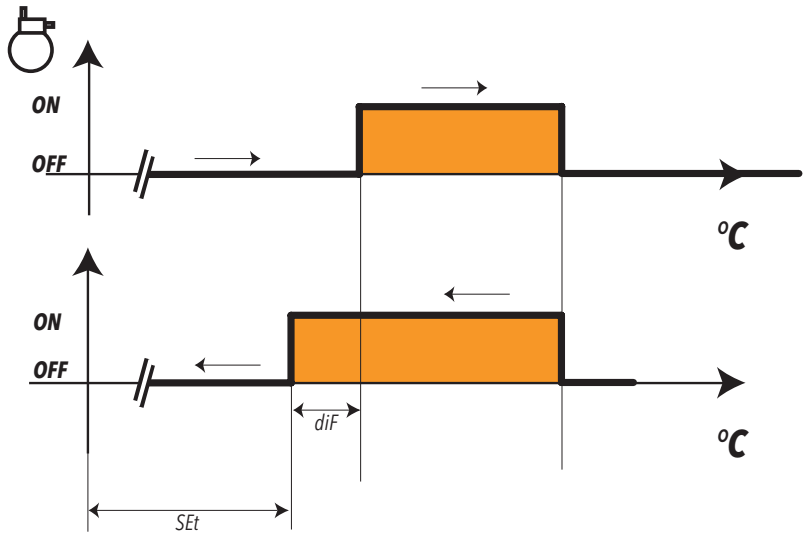
- the device is ON
- there is not an alarm **E1** indicating control probe fault
- the time set in parameter **OdO** has elapsed
- a defrost cycle is not underway (except in FREE mode)

(There is a fixed interval of one second between the request and activation of the relay)

The parameters that control this regulator are:

- the setpoint that can be set via the keypad, with a range from minimum to maximum setpoint.
- the differential

The diagram below indicates the compressor activation mode for cooling based on parameters **SEt** and **diF** > 0.



6.5. COMPRESSOR/GENERAL PROTECTIONS

Description

If the cold room probe is in error **E1** the output relay configured as compressor/general regulates in accordance with the times set in parameters **Ont** and **OFt**.

The first time to consider is **Ont**.
If **Ont >0** the protection programmed in parameters
dOn-dOF-dbi (see safety compressor times).

NOTE: remember that parameter **OdO** inhibits the activation of all outputs commanding a relay for its entire duration (compressor/general, defrost, fans), excluding buzzers or alarm relays.

Operating conditions

The table below lists the ways the compressor relay output can be managed:

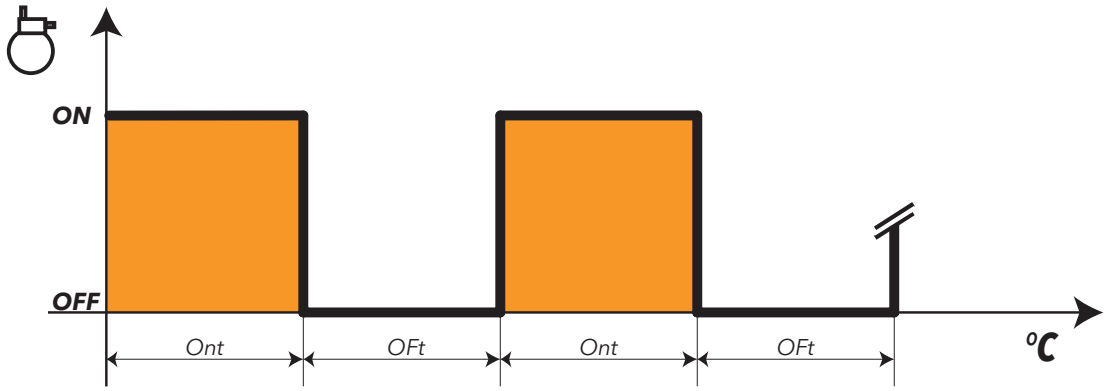
Ont	OFt	Compressor OUT
0	0	OFF
0	>0	OFF
>0	0	ON
>0	>0	Duty-cycle

If **Ont** > 0 and **OFt** = 0 the compressor regulator entrusts relay deactivation to the safety protection **CAt**.

If **Ont** > 0 and **OFt** > 0: the compressor regulator activates in operating cycle mode irrespective of the values read by the probes (cold room probe failure) and of requests from other loads (**Duty-cycle** mode).

If the cold room probe is working properly, Duty-cycle mode does **NOT** activate as it does not have priority over normal compressor regulator settings.

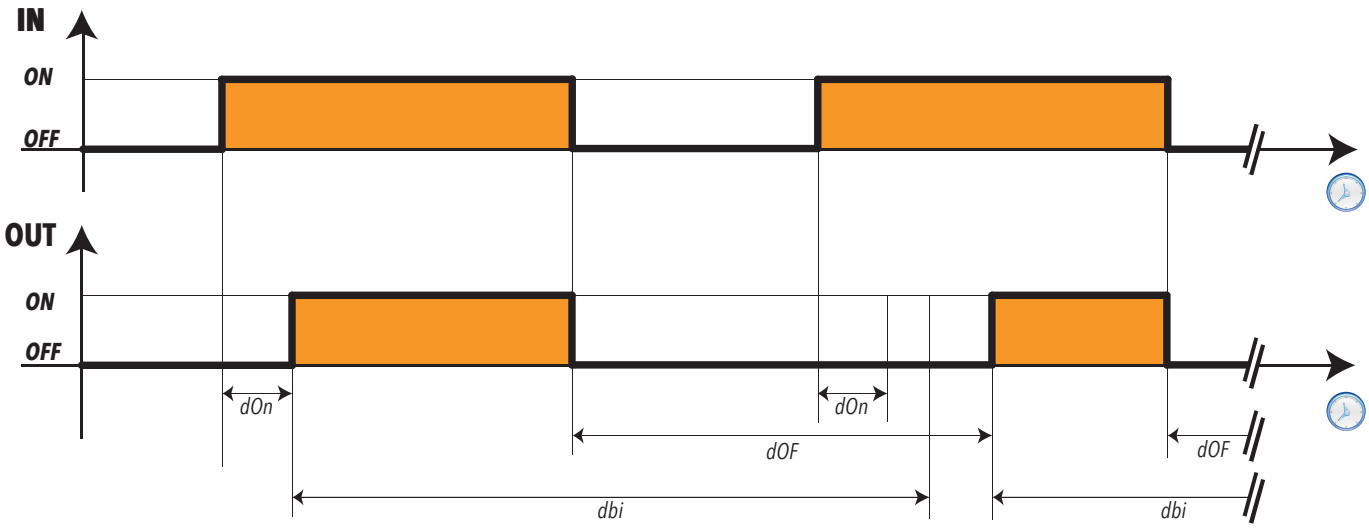
The following diagram shows the **Duty-cycle** operating mode, based on parameters **Ont** and **OFt > 0**:



6.5.1. Compressor safety timings

Compressor on-off operations must respect the safety times that you can set using the special parameters as described below.
The compressor icon will flash to indicate when a compressor activation request has been received but a safety protection exists.
A safety time (compressor On... Off safety time) regulated by the parameter **dOF** must be respected between a switch-off and switch-on of the same compressor. This waiting time also occurs at switch-on of the device.
A safety time regulated by the parameter **dbi**must be respected between one switch-on and the next.
The safety time set in parameter **dOn** must elapse between a compressor start-up request and actual start-up.
Times set with parameters **dOn**, **dOF** and **dbi**, if active, are not accumulative but parallel.
The following diagram illustrates the operation of the compressor protection with parameters **dOn**, **dOF**, **dbi** set where:

IN	Input status for compressor regulator.
OUT	Output status for compressor regulator.



NOTE: See the chapter entitled Compressor Function During Defrost for other safety measures and compressor timings.

Maximum timer period
The maximum compressor activation time before its deactivation can be set via the parameter **CAt**.
Minimum timer period
The minimum compressor activation time before its deactivation can be set via the parameter **Cit**.

User parameters

The parameters that manage this regulator are:

Label	Description
Ont	Compressor output ON time in the event of a faulty Pb1 probe
OFt	Compressor output OFF time in the event of a faulty Pb1 probe
dOn	Compressor output activation delay from request
dOF	Compressor output activation delay from shutdown
dbi	Delay between two consecutive starts of the compressor output
OdO	Output activation delay from power-on
Cit	Minimum compressor output activation time
CAt	Maximum compressor output activation time

6.6. DEFROST/DRIPPING

6.6.1. Defrost type and activation

Defrost is used to stop ice from forming on the surface of the evaporator.
Its **activation** can be:

- automatic, in one of the following modes selected via **dCt**:
  - compressor hours (Digifrost);
  - device hours;
  - compressor stop;
  - via clock (see corresponding paragraph under RTC);
- via digital input (DI);
- via key;
- remotely.

The **type** of defrost can be selected via the parameter **dty** and can be:

1. defrost with electric heaters;
2. inverse;
3. FREE

Dripping

On completion of defrost, given that there will be water on the evaporator, it is better not to start “cooling” right away as this would ruin the effect of the defrost by creating ice immediately.
The dripping interval is regulated via parameter **dt**.

Defrost conditions and operation

Defrosting is enabled if:

- the evaporator temperature, read by probe 2, is lower than the defrost end setpoint configured via parameter **dSt**
- manual defrosting has not already been activated, in which case the request for automatic defrost will be cancelled.

Defrost requests can be made in the following ways:

Controller power-on	if parameter **dPO** (defrost at power-on) is programmed accordingly.
Time intervals	if **dit** > 0 whenever the defrost time interval set in parameter **dit** elapses.
Manually (via key)	by pressing the **UP** key The cycle will not start if **OdO≠0**; the request will be refused and the display will flash three times to indicate that defrost is impossible.
External request via digital input (DI)	If the digital input (DI) is suitably configured. Activation via digital input (DI) respects the protections of the automatic cycle. The cycle will not start if **OdO≠0**; the request will be refused and the display will flash three times to indicate that defrost is impossible.

HACCP models also offer the following mode:

Time	if **dit = 0** and **dCt=3** with rtc function (real time clock). At the times set in parameters dE1...dE8 (dd folder)

6.6.2. Automatic defrosting

The defrost cycle is programmed to start at intervals.

NOTE: To disable the automatic cycle, set **dit**=0.

If **dit>0**, the defrost cycles will be run at fixed intervals, as indicated in parameter **dit** and the interval time is counted as follows:

Par.	Value	U.M.	Description	Notes
dCt	**0**	num	Hours of compressor compressor (DIGIFROST method®)	In this case, the counter runs only if the compressor is on. A new count starts when the defrost interval elapses and a new defrost cycle starts if conditions permit. **NOTE**: compressor running time is counted separately from the evaporator temperature. If the evaporator probe is missing or faulty, the count continues for the time the compressor is on.
	1	num	Device running time	The defrosting interval is counted continuously when the device is on and starts at each power-on. A defrost cycle starts when the defrosting interval elapses (indicated by dit) if conditions permit and the controller immediately starts counting a new defrosting interval.
	2	num	Compressor stop	Each time the compressor stops, a defrost cycle is run according to the mode set in parameter **dty**.
	3	num	RTC (clock)	The clock can be used to set: • defrost times (**6** bands for weekdays and **6** bands for weekends/holidays), • regular defrosts (every **n** days) • daily events (**1** event for weekdays and **1** event for weekends/holidays) Time band defrosts and periodic defrost are mutually exclusive functions (they cannot be activated simultaneously). If defrost by RTC has been enabled and the clock has failed, the defrost will run according to the mode set in **dit** (provided the value is **≠ 0**).

NOTE: regardless of how the interval is counted, the following conditions apply:

If parameter **OdO** is underway or the temperature read by the evaporator probe is higher than **dSt**, then defrost will not be permitted: a new interval will be counted and only at the end of this subsequent count will conditions be tested for the start of a defrost cycle.

6.6.3. Manual defrost

Press and hold the manual defrost key **ESC** (or from digital input (DI) if appropriately configured **H11...H13 = 1**), the device enters defrost. Procedures for the activation of this defrost cycle are the same as for external defrost.

The defrosting interval will now be counted as described for Automatic Defrost (time **dEt** is not cleared, it continues).

If the conditions for defrost activation are not present, i.e.:

- the time set in parameter **OdO** has not elapsed
- the evaporator temperature is higher than the value set in parameter **dSt**

this will be indicated on the display (screen flashes three times) and the defrost will stop.

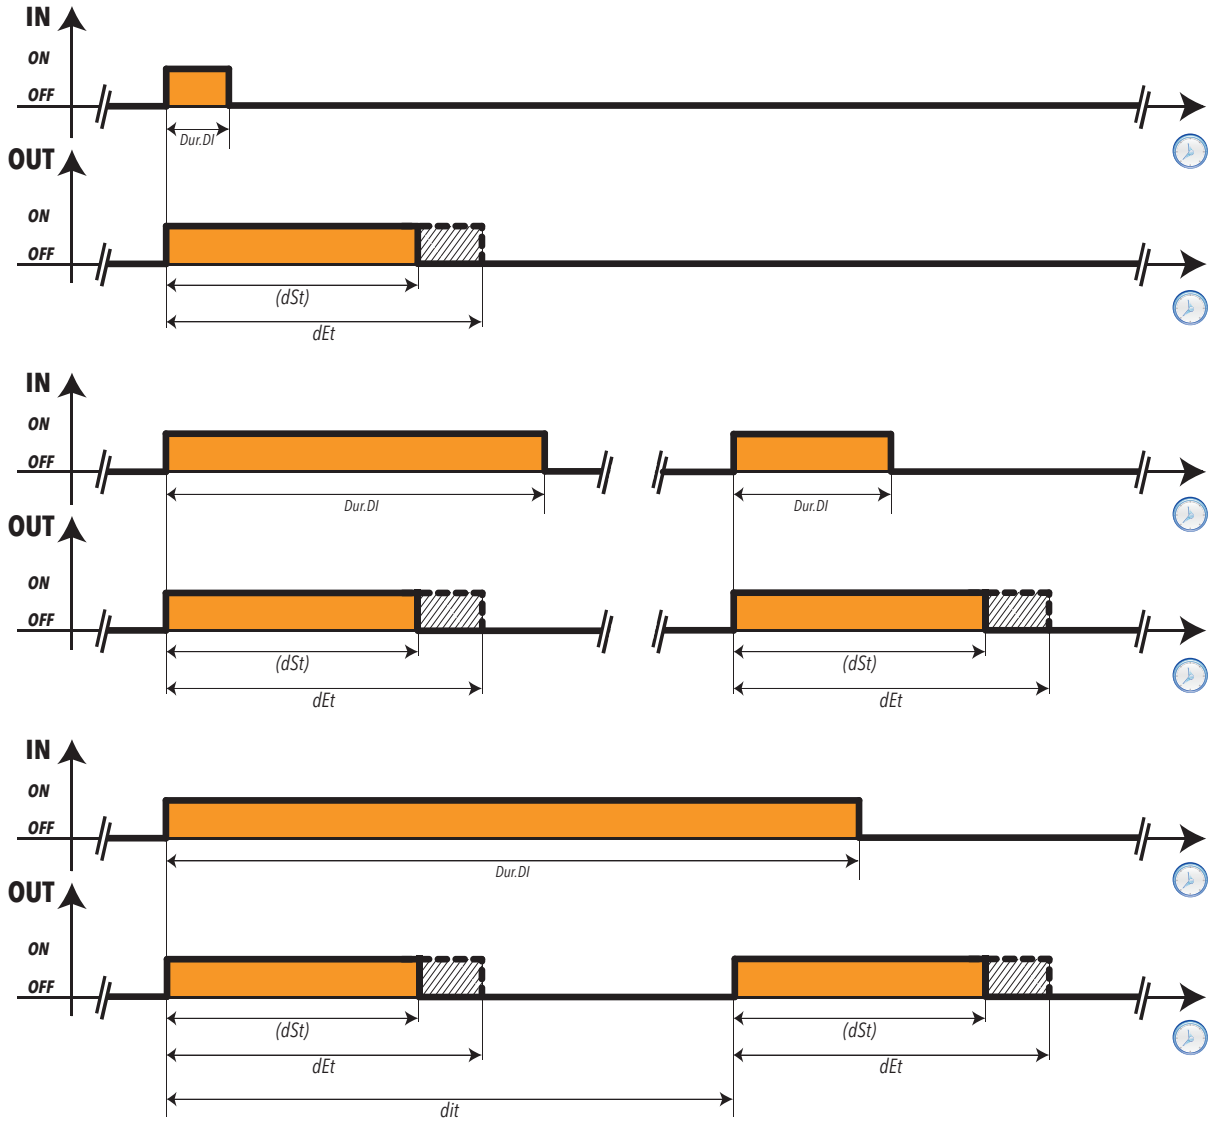
Manual defrost is always enabled except when **dit** = 0.

6.6.4. External defrost

If the Digital Input is configured for this function (if **H11...H13 = 1**) and if conditions permit, defrost can be requested and the corresponding regulator activated.
Time graphs for signals in each of the various function modes are presented below.

NOTE: Defrost activation occurs when the signal is toggled and the polarity can be selected.
Hence you can only activate a defrost, NOT stop one that is underway.
Defrost or dripping currently underway and the defrost or dripping interval count cannot be suspended.

IN (Digital Input)	Input status for defrost regulator, with activation from Digital Input.
OUT (Defrost)	Output status for defrost regulator.
DurDI	Digital Input duration.
NOTE:	**dSt** indicates end defrost time when Setpoint temperature reached and **dEt** indicates end of defrost due to timeout.



6.6.5. Defrost WITH REMOTE START/STOP

If the Digital Input is configured for this function (if **H11...H13 = ±22**) defrost with start/stop is activated from remote.
The defrost is switched on when the digital input becomes active. Vice versa, when the digital input is disabled, the defrost ends.

If the automatic defrost is also active, the two functions will proceed in parallel. In this case, the defrost interval set in the parameter dit will be reset when the remote defrost is activated (digital input).
Having ended the remote defrost, the dripping function will be activated if **dt** > 0.

The conditions for activation are:
- Defrost probe present and temperature lower than **dSt**;
- Defrost not inhibited by an alarm.

The defrost will not be activated if the following conditions are present:
1. Defrost end probe present and temperature higher than **dSt**;
2. Alarm condition inhibiting the defrost,

The defrost may end before the defrost is disabled from the digital input (DI) if:
- **dEt** ends the count;
- Defrost probe present and temperature higher than **dSt**;
- Alarm condition ending the defrost early.

To manage the activation delays of the digital inputs DI1 and DI2 separately:
- Set **dAd** = 0;
- Add a delay using parameters **O1i** (to delay the activation of digital input DI1) and **O2i** (to delay the activation of digital input DI2), the delay of the digital input DI3 can be set using parameter **di3**.

NOTE: If **dAd** ≠ 0, any delays set in **O1i** and **O2i** will not be considered by the instrument.

User parameters

Label	Description
dAd	Delay activating digital input DI1 and digital input DI2.
O1i	Delay activating digital input DI1
O2i	Delay activating digital input DI2
di3	Delay activating digital input DI3

6.7. DEFROST MODE

6.7.1. Defrost with electric heaters

Defrost with electric heaters is configured via parameter **dty = 0**.

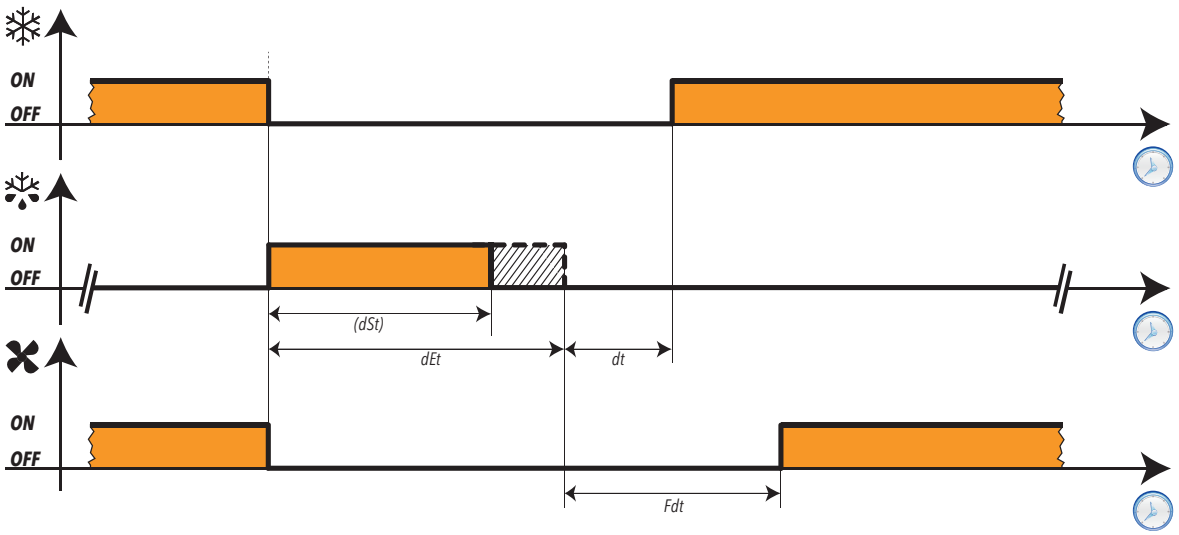
The compressor remains stopped for the duration of the defrost cycle and the relay configured as defrost regulator output, to which the electric heaters are connected, activates. On completion of defrost, the electric heaters are switched off and the compressor remains off for the dripping time set in parameter **dt**, if it is not equal to zero.

Defrost ends due to:

Evaporator Probe	End of defrost description
Evaporator Probe ABSENT	Due to timeout set in parameter **dEt** (defrost timeout)
Evaporator Probe PRESENT	Temperature setpoint for the end of defrost set in parameter **dSt** reached. If this setpoint is not reached within the time set in parameter **dEt** (defrost timeout), the defrost will end due to timeout.

NOTES:
- If **dSt** intervenes before **dEt**, dripping (**dt** and **Fdt**) aligns with **dSt**.
- If **Fdt** < **dt** then **Fdt** = **dt**.
- During defrost, fans are OFF if parameter **dFd** is set accordingly, otherwise they will behave as set for the fan regulator.

The operating diagram is as follows:



Key:

	Output status for **Compressor regulator**
	Output status for **Defrost regulator**
	Output status for **Evaporator Fan regulator**

6.7.2. Inverse defrost

Hot gas defrost is configured by setting parameter **dty = 1**.

The compressor stays on for the entire duration of the defrost cycle and the relay configured as defrost regulator output, and that the solenoid valve is connected to, activates.
On completion of the defrost cycle, the valve relay is de-energised and the dripping phase set in parameter **dt** (if not equal to zero) is interrupted. The compressor relay is once again controlled by the compressor regulator.

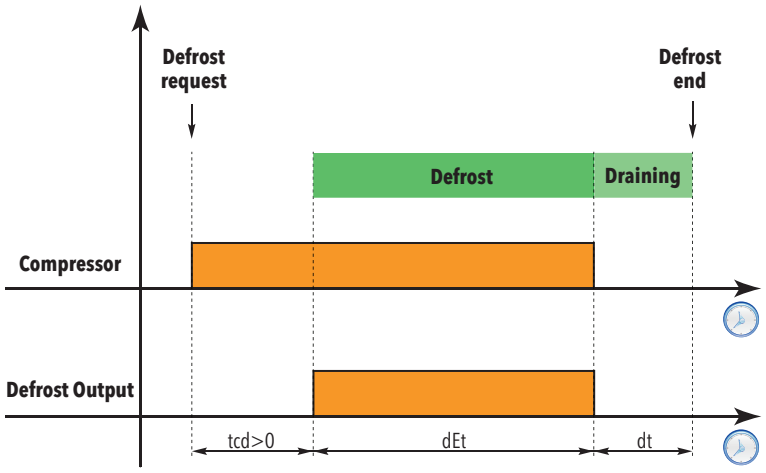
Defrost ends due to:

Evaporator Probe	End of defrost description
Evaporator Probe ABSENT	Due to timeout set in parameter **dEt** (defrost timeout)
Evaporator Probe PRESENT	Temperature setpoint for the end of defrost set in parameter **dSt** reached. If this setpoint is not reached within the time set in parameter **dEt** (defrost timeout), the defrost will end due to timeout.

NOTE: Parameters **dOn**, **dOF** and **dbi** still have priority.

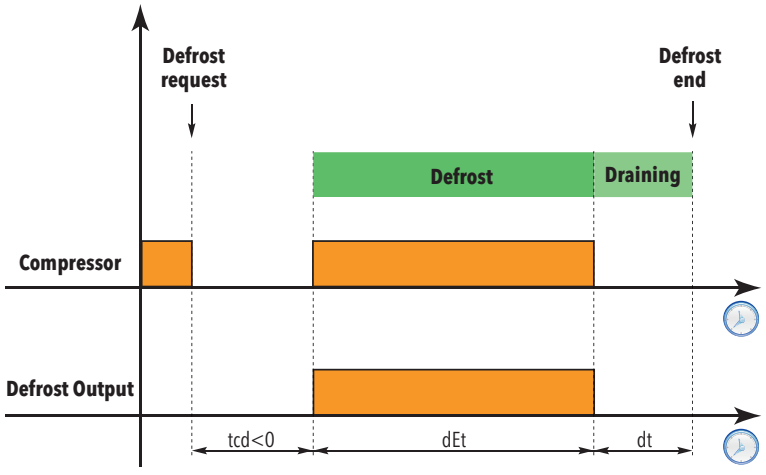
NOTES:
- If **dSt** intervenes before **dEt**, dripping (**dt** and **Fdt**) aligns with **dSt**.
- If **Fdt** < **dt** then **Fdt** = **dt**.
- During defrost, fans are OFF if parameter **dFd** is set accordingly, otherwise they will behave as set for the fan regulator.

The operating diagram is as follows:



Example tcd>0

Defrost Request	= Start defrost request
Defrost	= Defrost time
Dripping	= Dripping time
Defrost end	= End of defrost
Compressor	= Compressor
Defrost Output	= Defrost output



Example tcd<0

Defrost Request	= Start defrost request
Defrost	= Defrost time
Dripping	= Dripping time
Defrost end	= End of defrost
Compressor	= Compressor
Defrost Output	= Defrost output

6.7.3. Double evaporator defrost

The defrost for a second evaporator can be controlled via the probe configured as second evaporator.

Configure a relay output (see configuration parameters **H21…H25**) as a defrost relay for evaporator 2.

To enable this function, you need to:

- set probe Pb3 to control defrost evaporator 2 mode (parameter **H43**).
- configure a relay output (see configuration parameters **H21…H25**) as a defrost relay for evaporator 2.
- Define defrost mode by setting parameter **H45**.

Input mode

A double evaporator defrost can take place in three different ways on the basis of parameter **H45**, as described below:

- **H45**=0: Defrost is enabled only when the temperature of evaporator 1 is lower than the value set in parameter **dSt**.
- **H45**=1: Defrost is enabled when the readings from at least one of the two probes is below its defrosting end temperature (**dSt** for evaporator 1 and **dS2** for evaporator 2)
- **H45**=2: Defrost is enabled when both probe values are below the corresponding end of defrost setpoints (**dSt** for evaporator 1 and **dS2** for evaporator 2)

The probe error condition is considered as a probe calling for defrost.

The defrost for every single evaporator ends when the following conditions have been met:

- the **dEt**/**dE2** timeout period has elapsed
- the **dSt**/**dS2** temperature has been reached

Ending mode

Defrost in the case of a double evaporator takes place when both probe values have reached or exceeded the relative end of defrost setpoints (**dSt** for evaporator 1 and **dS2** for evaporator 2)

If one or both probes are in error, the end of defrost will take place due to timeout.

In any case

If there are no conditions for performing the defrost the request will be cancelled.

The defrost for a single evaporator will end when the corresponding probe reaches or exceeds the defrosting end temperature or when the timeout period begins.

Dripping begins when both defrosts have ended.

If one or both probes are in error, the defrost for the corresponding evaporator will end due to timeout. Onset is allowed as if the corresponding temperature is lower than the corresponding setpoint **(dSt or dS2)**.

If the probe is not configured to be the probe for the second evaporator (**H43** ≠2), the defrost for the second evaporator may take place if a digital output is configured to control defrost on the second evaporator (**H21..H25** = 9). In this case consent for defrost will be granted, as if the probe temperature (evaporator 2) < **dS2** and the output takes place due to timeout. The fan regulator is not affected.

User parameters

The parameters that manage this regulator are:

Label	Description
dty	Selects defrost type
dit	Time interval between 2 consecutive defrost cycles
dCt	Selects the count mode for the defrost interval
dOH	Defrost cycle activation delay after request
dEt	Defrost timeout evaporator 1. Determines the maximum defrost duration
dE2	Defrost timeout evaporator 2. Determines the maximum defrost duration
dSt	Defrost 1 end temperature - determined by evaporator probe 1
dS2	Defrost 2 end temperature - determined by evaporator probe 2
dPO	Determines whether the instrument must enter defrost mode at power-on
Fdt	Fan activation delay after a defrost cycle
dt	Dripping time
dFd	Allows exclusion of the evaporator fans to be selected or not selected during defrosting.
dAO	Temperature alarm disabling time after defrost cycle
dAt	Alarm signalling end of defrost due to timeout
ddL	Display mode during defrost cycle (lock display.)
Ldd	Timeout value for display unlock - label **dEF**

Summary table

Defrost on evaporator 1

Defrost START		Defrost END
If **H45**=0	Probe Pb3 (evaporator 2) (evaporator 1) temperature < **dSt**	Probe Pb3 (evaporator 2) (evaporator 1) temperature > **dSt** or if Probe Pb3 (evaporator 2) (evaporator 1) temperature <**dSt** due to time-out or if probe Pb2 in error due to timeout
If **H45**=1	Probe Pb3 (evaporator 2) (evaporator 1) temperature < **dSt**	
If **H45**=2	Probe Pb3 (evaporator 2) (evaporator 1) temperature < **dSt** and Probe temperature (evaporator 2) < dS2	
Note: if the probe is in error or **H43** ≠2 and a digital output is configured as a regulator for the second evaporator, the following condition applies: Probe temperature (evaporator 2) < **dS2**		

Defrost on evaporator 2

Defrost START		Defrost END
If **H45**=0	Probe Pb3 (evaporator 2) (evaporator 1) temperature < **dSt** and Probe temperature (evaporator 2) < **dS2**	Probe 3 temperature (evaporator 2) > **dS2** or if Probe temperature (evaporator 2) < **dS2** due to timeout or if probe in error due to timeout.
If **H45**=1	Probe temperature (evaporator 2) < **dS2**	
If **H45**=2	Probe Pb3 (evaporator 2) (evaporator 1) temperature < **dSt** and Probe temperature (evaporator 2) < **dS2**	
Note: if the probe is in error or **H43** ≠2 and a digital output is configured as a regulator for the second evaporator, the following condition applies: Probe temperature (evaporator 2) < **dS2**		

Dripping

Drip cooling START	Drip cooling END
End of defrost for both evaporators if defrosting takes place for both evaporators, otherwise end of the only defrost in progress	Unchanged

6.8. EVAPORATOR FANS

6.8.1. Evaporator fan operating conditions

The regulator is active when:

- the time set in parameter **OdO** has elapsed.
- the temperature of the evaporator probe, if present, is between the values of parameters **Fot** and **FSt**
- during defrost it is not excluded by the parameter **dFd** (**dFd = y**).
- dripping is not active (**dt**).
- the fan delay is not active after defrost (**Fdt**).

The request to switch fans on or off can be made in the following ways:

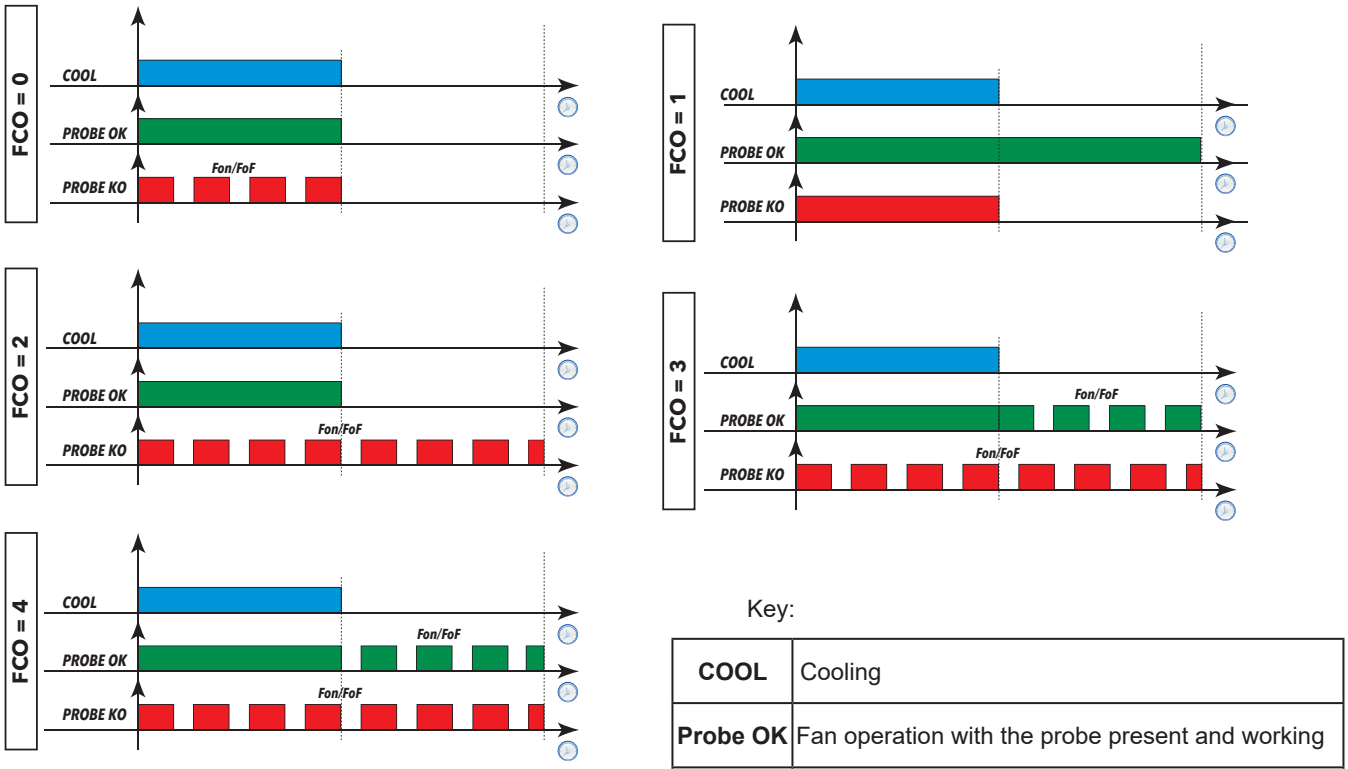
- by the compressor regulator to help in the “cooling” process (temperature control mode.)
- by the defrost regulator to check and/or limit the diffusion of hot air.

	FCO	Compressor ON	Compressor OFF
Probe present and working	0	THERMOSTAT CONTROLLED	OFF
	1	THERMOSTAT CONTROLLED	THERMOSTAT CONTROLLED
	2	THERMOSTAT CONTROLLED	THERMOSTAT CONTROLLED
	3	THERMOSTAT CONTROLLED	DUTY-CYCLE*
	4	THERMOSTAT CONTROLLED	DUTY-CYCLE* **
Probe present but in error	0	DUTY-CYCLE	OFF
	1	ON	OFF
	2	DUTY-CYCLE	DUTY-CYCLE
	3	DUTY-CYCLE	DUTY-CYCLE
	4	DUTY-CYCLE	DUTY-CYCLE
Probe absent	0	ON	OFF
	1	ON	ON
	2	DUTY-CYCLE*	DUTY-CYCLE*
	3	ON	DUTY-CYCLE*
	4	ON	DUTY-CYCLE* **

* see paragraph “Fan operation with probe Pb2 absent” (H42 ≠ 0).

** Normal Duty-Cycle operation reversed (OFF cycle - ON cycle)

The graphs below illustrate fan operation on the basis of the **FCO** value.
In the graphs, we can see that:



Key:

COOL	Cooling
Probe OK	Fan operation with the probe present and working
Probe KO	Fan operation with the probe present but in error

6.8.2. Fan operation in temperature control mode

During “cooling”, the fans operate as shown in this diagram:

Thermostat control of fans takes place at the values set in parameters

- **FSt** (fan disabling temperature) and **FAd** (fan differential).
- **Fot** (fan start temperature) and **FAd** but with the sign inverted.

By default, the fan disabling temperature, set by parameters **FSt** (fan disabling temperature) and **FAd** (fan differential), is an absolute value, as **FPt = 0** (actual temperature value).

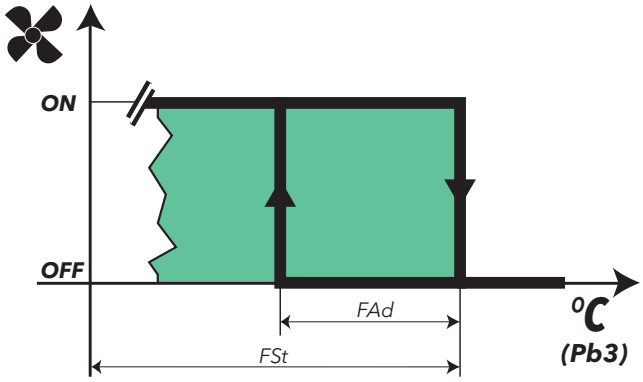
Depending on the parameter **FPt**, the fan disabling temperature set at parameter **FSt** can be absolute (actual temperature value) or relative (value to add to the Setpoint SEt).

Depending on the parameter **FPt**, the fan start temperature set at parameter **Fot** can be absolute (actual temperature value) or relative (value to add to the Setpoint SEt).

NOTE: if as an absolute value the parameter **Fot** is greater than **FSt** the fans will be excluded

Around the fan start temperature (-50°C by default) the differential will always take account of the differential parameter **FAd** but with the sign inverted (negative side). Fan stop in **Fot**, and activation at value (**Fot** + **FAd**).

The fan regulator operates as indicated below:



6.8.3. Fan operation in Duty-Cycle mode

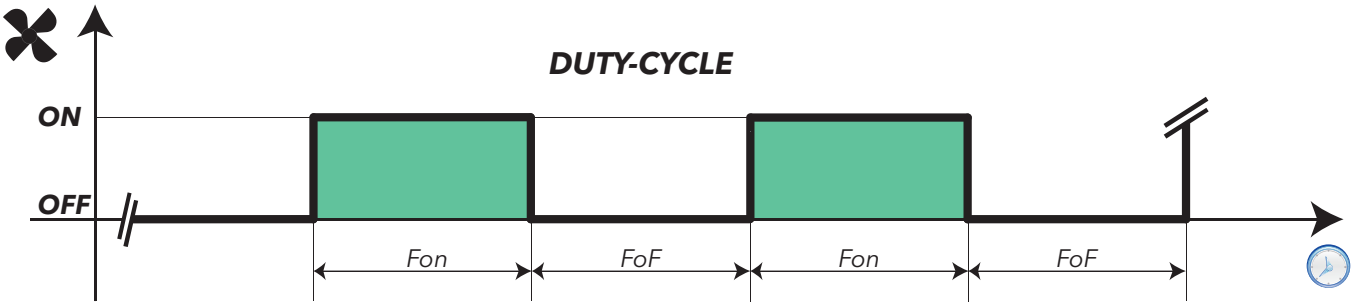
For Duty-cycle operation, parameters **Fon** and **FoF** must be set accordingly;

The fans operate as follows:

DUTY-CYCLE

Fon	FoF	Fan operation
0	0	OFF
0	≠0	OFF
≠0	0	ON
≠0	≠0	DUTY-CYCLE

The fan regulator will operate in Duty-cycle mode as illustrated below:



6.8.4. Fan operation in defrost

During defrost, the fans operate as shown in this diagram

dFd = n:	the fans are not excluded during defrost (see parameters **FCO**, **Fon**, **FoF**)	TEMPERATURE CONTROL / DUTY-CYCLE
dFd = y:	exclusion of fans during defrost	OFF

Thermostat control of fans takes place at the values set in parameters:

- **FSt** (fan disabling temperature) and **FAd** (fan differential).

NOTE: during defrost with electric heaters, the compressor is OFF but the fans work as if the compressor was still ON, unless they have been disabled during defrost (see parameter **dFd**).

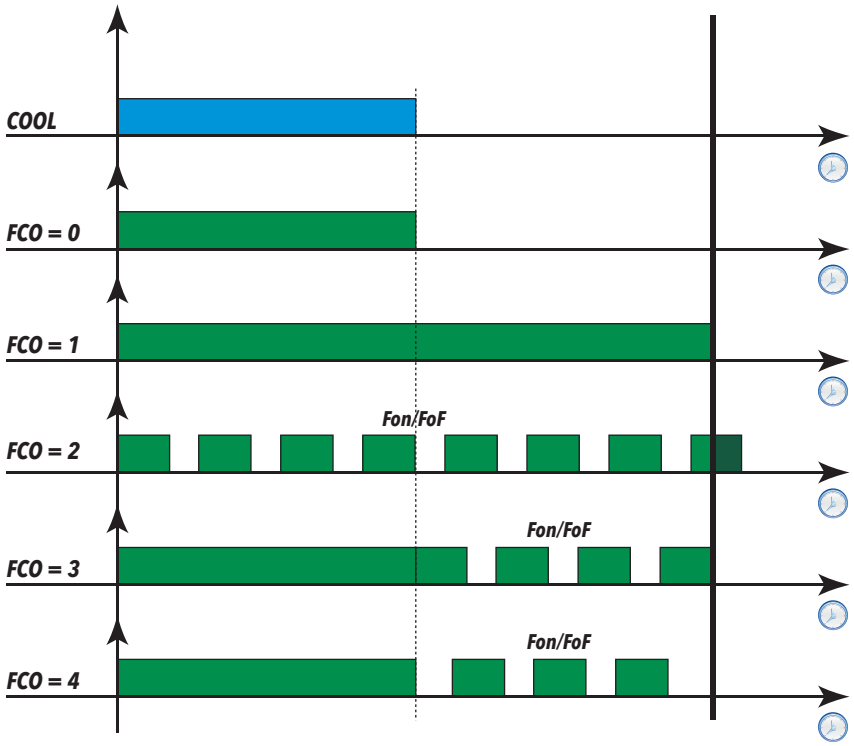
When the evaporator fans are enabled in defrost (**dFd = n**) and regulate the evaporator probe Pb2 in thermostat controlled mode, when the latter enters error “E2” during defrost, the fans must always be ON, regardless of the values set via the Duty-cycle.

Fan operation without probe

If parameter **H42** = **n** (probe Pb2 absent), depending on the FCO value and the status of the compressor, the fans may assume the status “On”, “Off”, “Duty-cycle”.

The parameter **FCO** will determine the operating mode of the evaporator fans during the DAY phase and the NIGHT phase.

The following is an example of fan operation on the basis of the value set for **FCO**.



6.8.5. Fan function during dripping

If parameter **dt ≠ 0** (dripping time), the fans will stay OFF for the time set in this parameter.
See "***Defrost with electric heaters***".
Note that if **Fdt** (fan delay time) is greater than **dt** (dripping time) the fans stay OFF for the time set in **Fdt** rather than **dt** (e.g. whichever timing is longer will be applied).

6.8.6. Post-ventilation

Parameter **FdC** delays the switching off of the fans after the compressor has stopped (increasing efficiency of the system by making better use of inertia). Post-ventilation must be active with any FCO value and without a configured probe.
If **FdC = 0** the function is disabled.

NOTE: Post-ventilation does not have priority over the delay set by parameter **dcd**.

User parameters

The parameters that manage the fan regulator are:

Label	Description
FPt	Characterises parameter "FSt" which can be expressed either as an absolute value or relative to the setpoint
FSt	Evaporator fan disabling temperature
Fdt	Evaporator fans delay after defrost cycle
dFd	Evaporator fans disabling during defrost time
FCO	Evaporator fans operating mode
FAd	Evaporator fans activation differential
dt	Dripping time
FdC	Evaporator fans switch-off delay after compressor deactivation
Fon	Evaporator fans ON time in duty-cycle mode
FoF	Evaporator fans OFF time in duty-cycle mode

6.9. DEEP COOLING CYCLE - DCC

Description

This regulator ensures that the compressor regulates the setpoint **dCS**, with differential equal to the value set via parameter **diF**. When the **DCC** (Deep Cooling Cycle) activates, the interval between defrost cycles is cleared and defrosts are disabled. Ending of the **DCC** is time-based, by setting the parameter **tdc≠0**, or when the setpoint **dCS** if **tdc = 0**.

When a **DCC** has ended and once the time set in parameter **dcc** has elapsed, a defrost cycle is forced and the counters restart for the interval between defrost cycles (value set via parameter **dit**). If **dcc=0** defrost begins at the end of the **DCC**.
During the **DCC** the temperature alarms are disabled.
Normal temperature alarm management is restored at the end of the **DCC**, when the temperature value read by probe **Pb1** reaches the regulation setpoint value **SEt**.

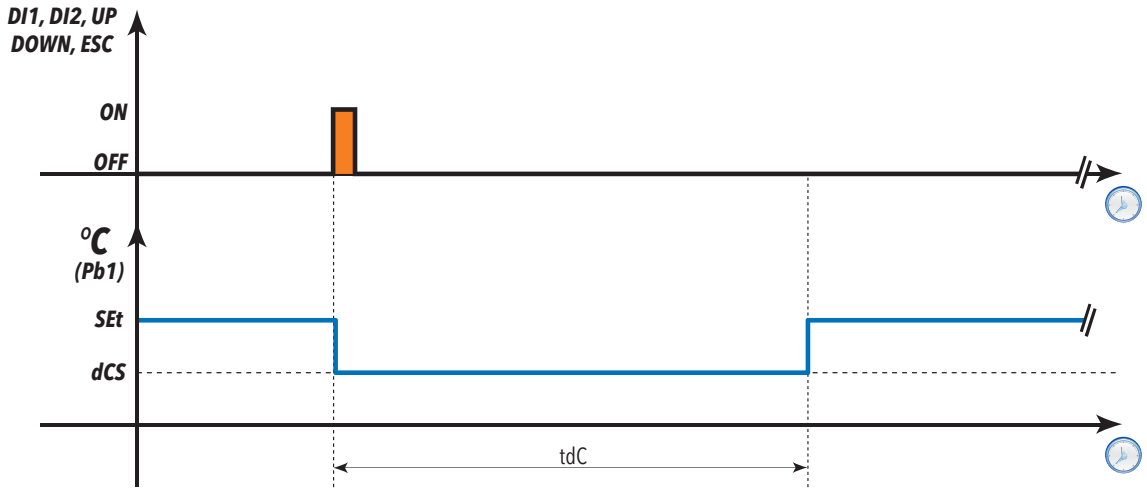
Operating conditions

The Deep Cooling Cycle will be activated via Digital Input or via a suitably configured key.

In the event of a probe error and/or power failure, the Deep Cooling Cycle is stopped and standard controller function restored.

If the **dCS** parameters are changed, **tdc** and **dcc** the functioning of the Deep Cooling Cycle is recalculated with new set values.

NOTE: After a Deep Cooling Cycle, the **dcc** time must elapse before a new cycle can begin.



User parameters

The parameters that manage the fan regulator are:

Label	Description
dCS	Deep Cooling set point
tdc	Deep Cooling Time
dcc	Delay Defrost after Deep Cooling

6.10. PREHEAT

The preheating phase is linked to a suitably configured digital input (**H11... H13 = ±12**).

In the period when the preheat output is active:

- the compressor output will be forced OFF;
- the compressor icon will flash.

The Preheat only affects defrosting in applications that require the use of the compressor (**dty**= 1 and **dty**= 2).

6.11. PRESSURE SWITCH

This regulator performs diagnostic procedures on an activated digital input by assigning the value **±11** (General pressure switch), **±09** (Minimum pressure switch) or **±10** (Maximum pressure switch) to one of the parameters **H11**...**H13**.

If a pressure switch input is activated, power to the compressor loads is immediately cut off, the corresponding alarm icon lights up to provide a visual warning and the alarms folder **ALr** is also displayed. The folder contains labels with the number of pressure switch activations (up to the maximum value set in parameter **PEn**):

- **P01, P02, ...P0n**... for general pressure switch
- **H01, H02, ...H0n**... for maximum pressure switch
- **L01, L02, ...L0n**... for minimum pressure switch

If the number of activations exceeds the maximum number defined by parameter **PEn** within a time less than the value of **PEi**, the following conditions occur:

- The compressor, fan and defrost outputs are disabled
- in the alarms folder **ALr** label **PA**, **LPA** or **HPA** are displayed (general, minimum or maximum pressure switch respectively).
- The alarm relay comes on (if configured).

NOTE: 1) if the number of activations exceeds the number set in **PEn** in the **PEI** time, the alarm is automatically reset.
2) the input must be:
- closed on itself if unused and the input is active when normally closed;
- open if unused and active when normally open;
- deactivated via digital input configuration parameter.

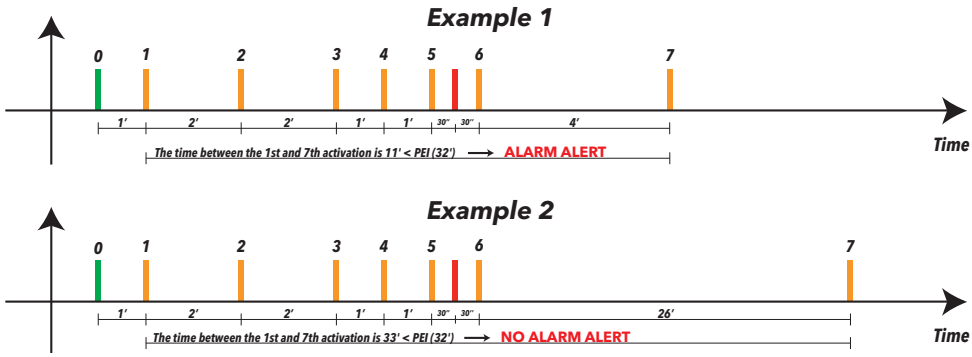
NOTES: 1) Once it has entered alarm status, the device must be switched off and on again, or reset using the **rPA** key in the functions menu.
2) If parameter **PEn = 0**, the function is disabled and alarms and counters are also disabled.
3) The pressure switch alarm is not stored in EEPROM
4) During the pressure switch activation period the defrost interval count runs as normal.

Operating conditions

The number of pressure switch errors is counted using a FIFO method. The time interval **PEi** is divided into 32 parts; the counter is incremented by one unit if there are one or more activations during one part of the entire interval **PEi**.
Two operating examples are given below: In both cases, suppose that **PEi** = 32' (equal to 32'/32 = 1 minute) and **PEn** = 7.

Example 1: ***ALARM SIGNALLED***. The interval for storing activations is 1 minute: all activations within that minute are counted as a single activation and the alarm is activated when the sampling interval has elapsed. In this example the pressure switch alarm is signalled because there have been 7 activations during the 32' time window.

Example 2: ***ALARM NOT SIGNALLED*** In this example the alarm is not activated because during the 32' time window the number of activations set in parameter **PEn** was not reached. In practice the time window is a rolling window and all activations that are outside of it are deleted: the reference point is the last activation and the time **PEi** is subtracted from that point to establish how many activations are included in the count.



The parameters that manage the pressure switch regulator are:

Label	Description
PEn	Number of errors allowed per general/maximum/minimum pressure switch input
PEI	General/minimum/maximum pressure switch error count interval (in 32 parts)

6.11.1. AUXILIARY OUTPUT (AUX/LIGHT)

Description

If one of the parameters **H21...H25** is set to the value **H2x=5**, it anticipates the relay control as AUX and, by pressing the associated key **H32...H35** which must be set to the value **H3x=2**, the relay is activated if it was off previously and vice-versa.

The on/off status is saved in non-volatile memory hence when power returns after a blackout, the device will restart in the status that was active prior to the blackout.

If one of the parameters **H11**...**H13** is set to the value**H11...H13=±3**, it anticipates the AUX relay control by the digital input; in this case the relay will mirror the status of the input. In this case, on/off status is not saved in non-volatile memory.

NOTE: the meaning of the digital input (DI) must always remain the same: for example, if the relay is activated by digital input (DI) and switched off by key, when the digital input (DI) is reset to the starting position, the relay does not change status (since it was already de-energised by key).
With the instrument OFF, if set accordingly, only the digital input (DI) and the associated key can change the status of the output.

Operating conditions

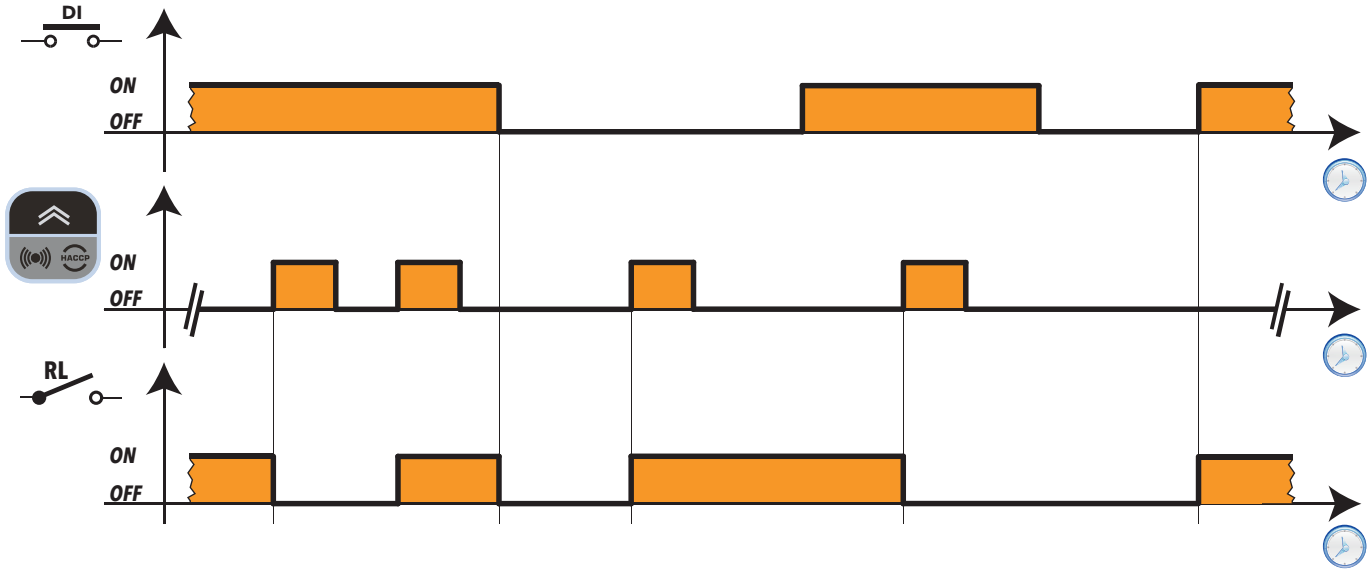
The regulator is activated by:

- Key
- Function
- Digital Input

if configured accordingly.

The regulator is not active when:

Condition	AUX output status
during start-up	OFF
during stand-by	status depending on parameters H06 and H08



User parameters

The parameters that manage the auxiliary (AUX) output regulator are:

Label	Description
H11...H13	Configuration of digital input 1...3 / Polarity
H21...H25	Configuration of digital output 1...5
H32...H35	Configuration of DOWN, ESC, ON/OFF, LIGHT key

6.12. DOOR/EXTERNAL ALARM MANAGEMENT

The door switch input is associated to an appropriately configured digital input (**H1x = ±4**).
By controlling the opening of the door, it is possible to disable the compressor output and/or the fans.

It is also possible to associate a deactivation delay with the compressor output by means of parameter **dCO**.
If the door is opened during a defrost cycle, the cycle is not shut down.

The values that can be set for the parameters involved are:

dod: Door switch switches off loads on digital input (DI) command

- **0** = function disabled
- **1** = disables fans (FAN)
- **2** = disables the compressor (COMP)
- **3** = disables the compressor (COMP) and fans (FAN)

Any protective timers (e.g. compressor start delay, etc.) will still be observed.

rLO: Locks compressor, defrost and fan regulators if the digital input (configured as external alarm) is activated.

- **0** = no resource locked
- **1** = Compressor and Defrost locked
- **2** = compressor, defrost and fans locked

dOA: Establishes what should be enabled/disabled on enabling/disabling of the Digital input. Only applies if **PEA** ≠ 0.

- **0** = activates the compressor (COMP)
- **1** = activates fans (FAN)
- **2** = activates the compressor (COMP) and fans (FAN)
- **3** = deactivates the compressor (COMP)
- **4** = deactivates fans (FAN)
- **5** = deactivates the compressor (COMP) and fans (FAN)

PEA: Establishes which of the door switch and alarm should be linked to the parameter **dOA** in the following way:

- **0** = function deactivated
- **1** = function linked to door switch
- **2** = function linked to external alarm
- **3** = function linked to door switch and external alarm

dCO: Compressor resource activation/power off delay (0 ...255 min).

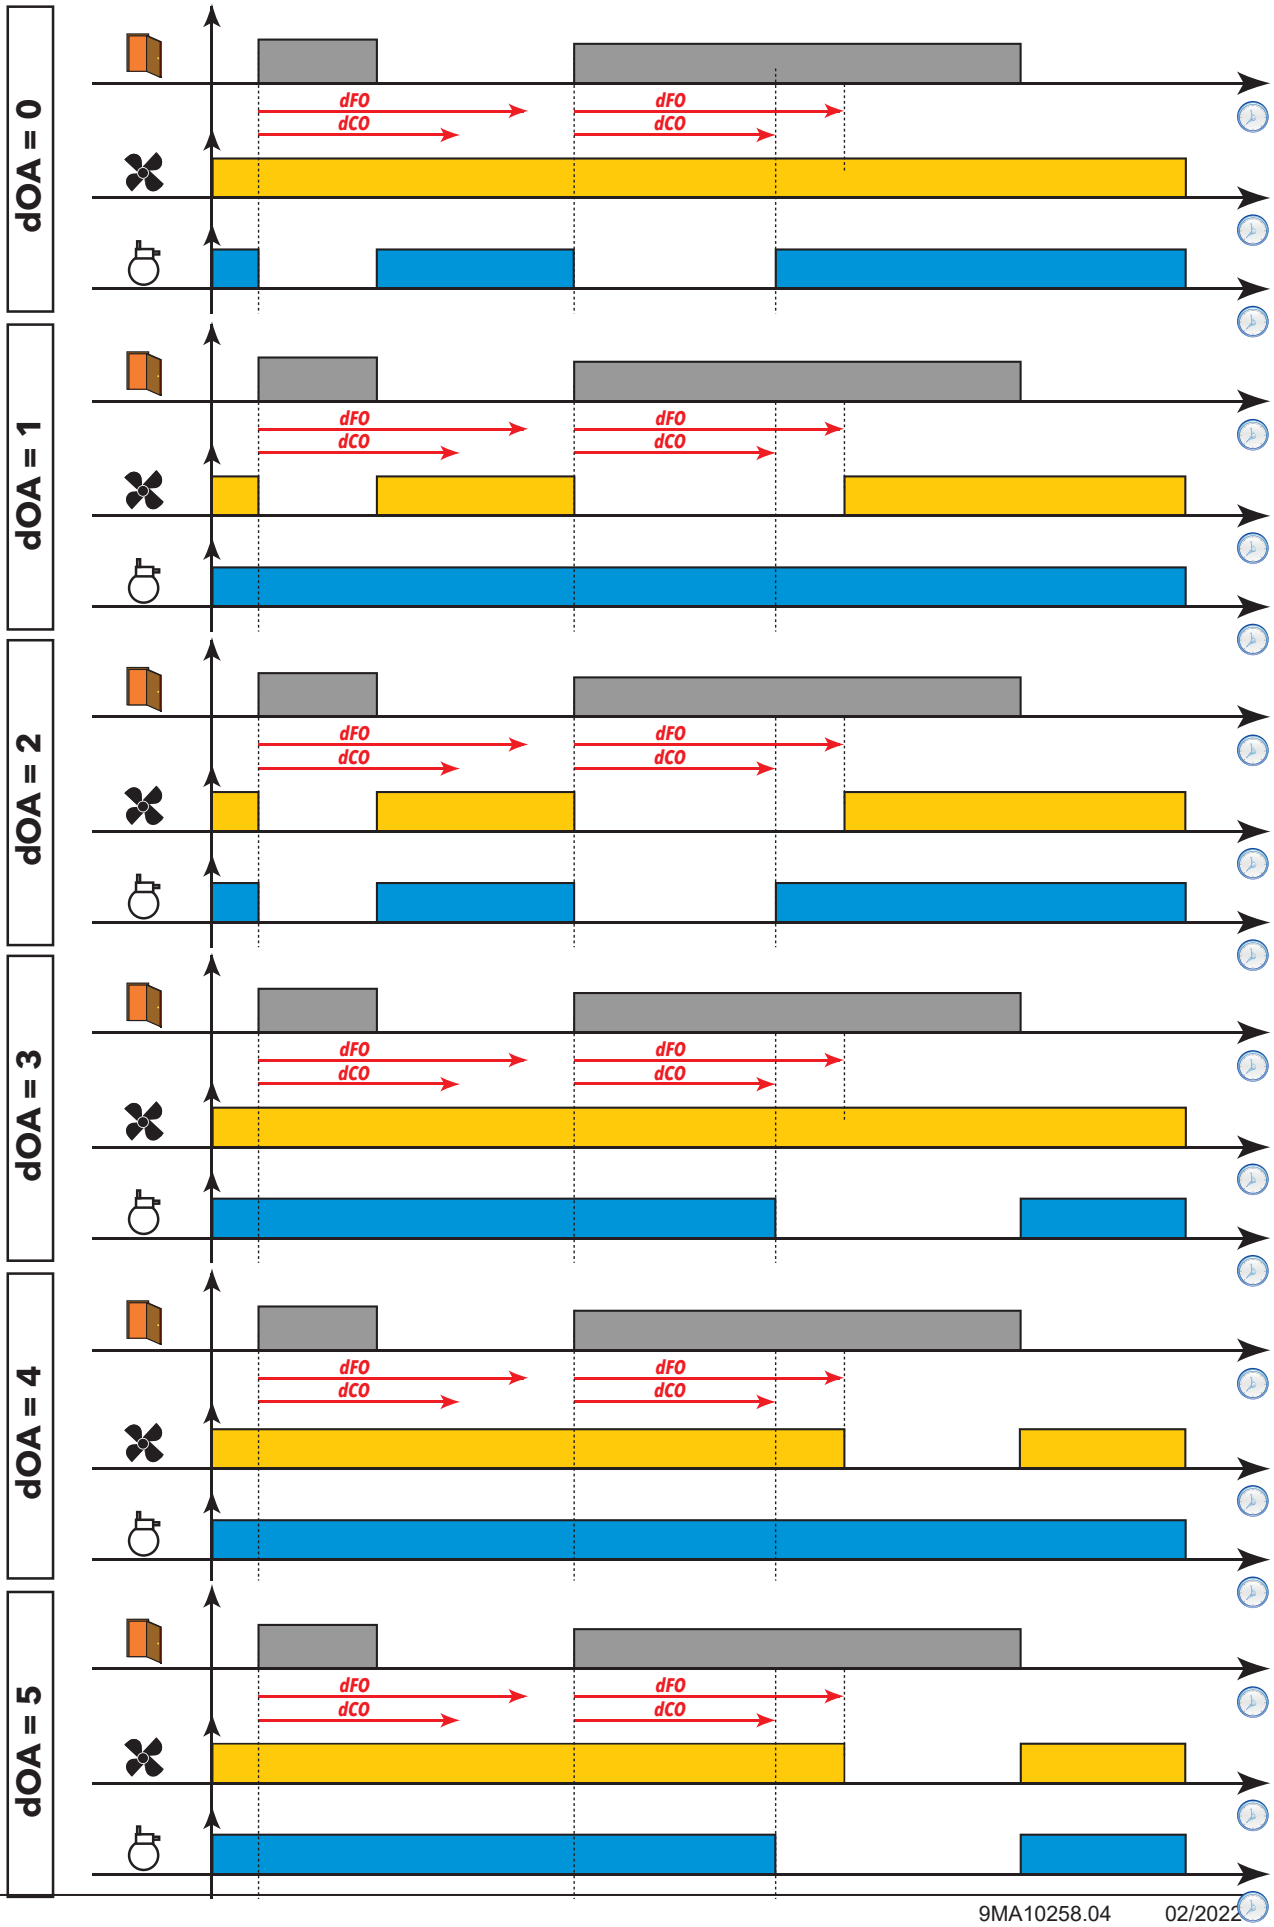
dFO: Evaporator fan resource activation/power off delay (0 ...255 min).

tdO: Door open alarm exclusion time (0...255 min). The door open alarm will be activated if the door remains open for a time period greater than the setting for this parameter.

The way in which parameters **dCO** and **dFO** act depends on how parameter **dOA** is configured. To better understand the meaning of these parameters, refer to the figures below.

The graphs below illustrate fan operation on the basis of the **dOA** value. In the graphs, we can see that:

	Door
	Evaporator fans
	Compressor



dOA = 0
dOA = 1
dOA = 2
dOA = 3
dOA = 4
dOA = 5
dFO
dCO

6.13. DEMISTING HEATERS (FRAME HEATERS)

The controller is equipped with a regulator for the demisting heaters.

Operating conditions

The table below lists the ways the relay output can be managed:

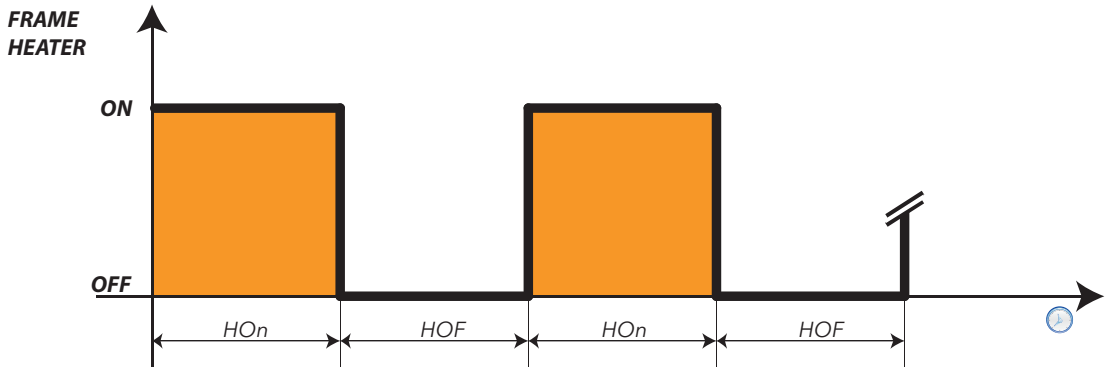
HOn	HOF	FRAME HEATER OUT
0	0	OFF
0	>0	OFF
>0	0	ON
>0	>0	Duty-cycle

Where **HOn** = 0 the regulator is always off, while if **HOn** > 0 and **HOF** = 0 the regulator is always on.

If **HOn** > 0 and **HOF** > 0: the regulator activates in operating cycle mode irrespective of the values read by the probes (cold room probe failure) and of requests from other loads (**Duty-cycle** mode).

If the cold room probe is working properly, the Duty-cycle mode does **NOT** activate as it does not have priority over normal regulator settings.

The following diagram shows the **Duty-cycle** operating mode based on the parameters **HOn** and **HOF > 0**:



User parameters

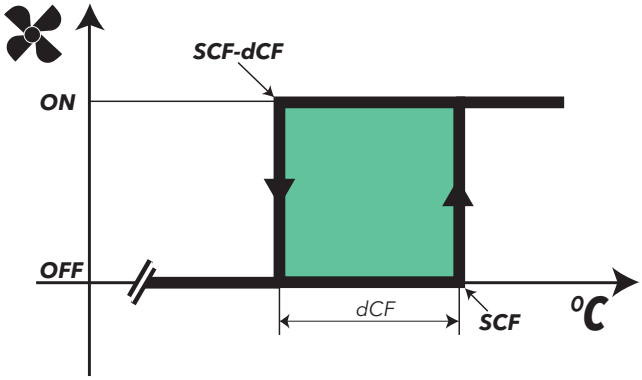
The parameters that manage the frame heater regulator are:

Label	Description
HOn	Frame Heater regulator output ON time
HOF	Frame Heater regulator output OFF time
dt3	Frame Heater regulator time standard unit of measurement: **0** = hours; **1** = minutes; **2** = seconds

6.14. CONDENSER FANS

This regulator is associated with probe Pb3 (see specific section) and features:
- intervention setpoint **SCF**
- operating differential **dCF**
- exclusion of fans during defrost **dCd**
- activation delay after end of defrost **tCF**

If a digital output is set as condenser fans (**H21...H25**=12), this output will behave as follows:



If probe Pb3 is not present and if alarm E3 is active, the regulator will always be active except during the defrost cycle. Probe 3 can be excluded and, in this case, its lack of connection to the instrument will not cause any error signalling to occur.
NOTE: During the dripping time the output is OFF.
NOTE: If a digital output is programmed as “condenser fans” (**H21...H25**=12), parameter **SA3** is always an absolute value, regardless of the value assumed by the parameter Att.

User parameters

The parameters that manage the condenser fan regulator are:

Label	Description
SCF	Condenser fans activation Setpoint
dCF	Condenser fans activation differential
tCF	Condenser fans switch-on delay after defrost
dCd	Exclusion of condenser fans during defrost
dt	Dripping time.

6.15. STAND-BY

Operating conditions

The stand-by regulator can be activated by digital input (if configured) or by key (if programmed).

With the device OFF the display shows “OFF” and all regulators are blocked including alarms.

When the device is switched on via a key or an appropriately configured digital input, regular operation commences, the same as from power-on. After power-on, the temperature alarm is excluded for a time set in parameter **PAO**, and the delay set by parameter **OdO** is activated.
Each time that the device is switched off, all cycle times are reset.
The on/off status is saved in non-volatile memory hence when power returns after a blackout, the device will restart in the status that was active prior to the blackout.
The output from stand-by is linked to the delay set in parameter **OdO**.

NOTE: With the controller off, all relays are de-energized except for Aux: button/aux input-light-door switch are active.

User parameters

The parameters that manage the stand-by regulator are:

Label	Description
PAO	Alarm disabling after power-on
OdO	Output activation delay from power-on
OAO	High/low temperature alarm exclusion time after door closing

6.16. PUMP DOWN

In some applications, Coldface manages the fluid solenoid valve, located in the cold room, while the refrigeration output is generated by a condenser unit, where the compressor is switched on/off directly by a minimum pressure switch on the unit itself.
Pump-down mode can be used to manage the compressor directly by connecting the minimum pressure switch to the Coldface, which means it can also be used for diagnostics.
The purpose of this regulator is to allow compressor activation (pump-down compressor output) exclusively on the basis of minimum pressure switch regulation and regardless of the status of the main temperature controller, which will be used to enable/disable solenoid valves (compressor output) instead.

6.16.1. Service stoppage

Service stoppage switches the cold room OFF, and this status is indicated on the display. It also allows compressor activation every time the pressure on the suction line rises until the minimum pressure switch starts running (pump-down).

7. PARAMETERS

7.1. HOW TO MODIFY THE USER PARAMETERS

The 'User' parameters are the most useful ones. This document describes them in the Parameter Table section.
1) Press and hold the SET button for at least 3 seconds, until the display shows USr
2) Press and release the SET key. The top display will show the first parameter, the bottom display will indicate the current parameter value
3) Using the UP & DOWN keys, find the parameter that you wish to modify
4) Press and release the SET key again. The top display will show the name of the blinking parameter
5) Use the UP & DOWN keys to adjust the parameter value
6) Press and release SET to save the parameter value
7) Return to step 3) or press ESC several times to return to the normal display.

IT IS POSSIBLE TO EDIT OTHER INSTALLER PARAMETERS (inS) ON THE INSTRUMENT

7.2. HOW TO EDIT THE INSTALLER PARAMETERS

1) Press and hold the SET key for 3 seconds until the display shows USr
2) Use the UP & DOWN keys to select the **inS** parameter section
3) Press and release the SET key again. The display will show the first folder
4) Press and release the SET key again. The top display will show the first parameter in the folder, the bottom display will indicate the current parameter value
5) Use the UP & DOWN keys to find the parameter that you want to change

The procedure progresses in a similar manner to that described for the User parameters (steps 4-7).

7.3. PARAMETER TABLE

PAR.	LEV.	DESCRIPTION	U.M.	RANGE	DEFAULT
SEt	USr/inS	Temperature control SEtpoint	°C/°F	-58.0...302	0.0
		COMPRESSOR parameters (CPr)			
diF	USr/inS	Activation differential N.B.: diF cannot be equal to 0.	°C/°F	0...30.0	2.0
HSE	USr/inS	Maximum value that can be assigned to the setpoint. NOTE: The two setpoints are interdependent: HSE cannot be less than LSE and vice versa.	°C/°F	LSE...HdL	50.0
LSE	USr/inS	Minimum value that can be assigned to the setpoint. NOTE: The two setpoints are interdependent: HSE cannot be greater than LSE HSE and vice versa.	°C/°F	LdL...HSE	-50.0
OSP	USr/inS	Temperature value to be added algebraically to the setpoint if reduced set enabled (Economy function). Enabling can take place via key, function or digital input configured specifically for this purpose.	°C/°F	-30.0...30.0	0.0
Cit	USr/inS	Minimum activation time of compressor before possible deactivation. If Cit = 0 it is not active.	min	0...255	0
CAt	USr/inS	Maximum activation time of compressor before possible deactivation. If CAt = 0 it is not active.	min	0...255	0
Ont	USr/inS	Controller switch-on time in the event of probe error. - if Ont = 1 and OFt = 0, the compressor stays on permanently (ON), - if Ont > 0 and OFt > 0, it operates in duty-cycle mode.	min	0...255	10
OFt	USr/inS	Controller switch-off time in the event of probe error. - if OFt = 1 and Ont = 0, the compressor stays OFF permanently, - if Ont > 0 and OFt > 0, it operates in duty-cycle mode	min	0...255	10
dOn	USr/inS	Delayed start. The parameter indicates that a protection is active on the general compressor relay actuations. At least the indicated time must elapse between the request and the actual activation of the compressor relay.	s	0...255	2
dOF	USr/inS	Delay time after power-off: the delay time indicated must elapse between deactivation of the compressor relay and the next power-on.	min	0...255	0
dbi	USr/inS	Delay between switch-ons; the delay time indicated must elapse between two consecutive compressor power-ons.	min	0...255	2
OdO	USr/inS	Delay in activating outputs after the instrument is switched on or after a power failure. 0 = not active	min	0...255	0
dSC	inS	Compressor 2 activation delay. Indicates the time after which the relay configured as compressor 2 will be activated in relation to the first compressor. If compressor 1 is disabled during this time, the call for compressor 2 will be cancelled.	s	0...255	0
dCS	inS	DEEP COOLING CYCLE Deep cooling cycle setpoint	°C/°F	-58.0...302.0	0
tdc	inS	Deep cooling cycle duration	min	0...600	10
dcc	inS	Delay defrost after deep cooling cycle	min	0...255	0
		DEFROST parameters (dEF)			
dty	USr/inS	Defrost mode 0 = electric defrost (defrost cycle OFF), or compressor not running during defrost. NOTE: electric defrost + air defrost, in the case of fans connected in parallel to the defrost output relay 1 = cycle inversion defrost (hot gas, or compressor on during defrost;) 2 = “free” mode defrost (independent of compressor)	num	0...2	0
dit	USr/inS	Interval between defrost cycles Time interval between the start of two consecutive defrost cycles. 0 = function disabled (defrost is NEVER activated). See dt1 for UM.	hrs/min/s	0...255	6 hours
dt1	inS	Unit of measure for defrost intervals (parameter dit). 0 = parameter dit in hours 1 = parameter dit in minutes 2 = parameter dit in seconds	num	0...2	0
dt2	inS	Unit of measure for duration of defrost (parameter dEt/dE2). 0 = parameter dEt/dE2 in hours 1 = parameter dEt/dE2 in minutes 2 = parameter dEt/dE2 in seconds.	num	0...2	1

PAR.	LEV.	DESCRIPTION	U.M.	RANGE	DEFAULT
dCt	USr/inS	Defrost interval count mode 0 = compressor running time (DIGIFROST® method); defrost active ONLY when compressor is on. N.B.: compressor running time is counted separately from the evaporator probe (count active even if the evaporator probe absent or error). 1 = device running hours; defrost count is always active when machine is on and starts at each power-up. 2 = compressor stop. Every time the compressor stops, a defrost cycle is run depending on parameter dty; 3 = RTC. Defrost at specific times set by parameters dE1...dE8, F1...F8	num	0...3	1
dOH	USr/inS	Defrost cycle enabling delay from request Delay preceding start of first defrost after call.	min	0...59	0
dEt	USr/inS	Defrost timeout Determines the maximum defrost time on Evaporator 1. See dt2 for UM.	hrs/min/s	1...255	30
dSt	USr/inS	Defrost end temperature Defrost 1 end temperature (determined by evaporator probe 1).	°C/°F	-58.0...302.0	6.0
dS2	inS	Evaporator 2 defrost end temperature Determines the maximum defrost time on Evaporator 2	°C/°F	-58.0...302.0	8.0
dE2	inS	Evaporator 2 maximum defrost duration Determines the maximum defrost time on Evaporator 2. See dt2 for UM.	hrs/min/s	1...255	30
dPO	USr/inS	Defrost enabling request from power-on Determines whether the instrument must enter defrost mode at power-on (provided that the temperature measured at the evaporator will allow defrost). n = no, does not start defrosting at power-on; y = yes, starts defrost at power-on	flag	n/y	n
tcd	inS	Compressor output activation/deactivation time before a defrost Minimum time that must elapse with the compressor ON or OFF before defrost is activated.	min	-31...31	0
Cod	inS	Time preceding a defrost, during which the compressor output is not activated	min	0...60	0
		Parameters dE1..dE8 / F1..F8 – ONLY VISIBLE IN HACCP MODELS **NOTE: do not confuse parameters dE1...dE8 with values d0 …d7 in folder nAd, used for the Day/Night regulator.**			
dE1..dE8 F1..F8		Parameters for setting the time of single defrosts • daily (dE1…dE8) • daily "weekends/public holidays" (F1..F8), used by the Day/Night regulator. The parameters will only be displayed if: • dit = 0 • dCt = 3 (Real time clock) • H48 = y (rtc option declared present) • the device has been switched off and on again after the above parameters have been set.			
dE1...dE8		Setting the time for defrosts on weekdays If parameter dit (defrosting interval) = 0, dCt = 3 and the rtC option is (declared) present, then parameters dE1...dE8 allow you to set the hours and minutes. Only on the basis of these values will a defrost cycle begin. If you do not wish to use some of the defrost times (dE1...dE8), exclude them as explained below: Select the parameter (dE1...dE8) that you want to exclude, then increase the value until 24 appears on the display, indicating that the parameter has been excluded. Bear in mind that the times do not have to be set in exact chronological order, e.g.: dE1 = h 12.25 dE2 = h 06.05 dE3 = h 18.30 …	hours/ mins	The parameter is then split into dEn_H (hours), dEn_m (minutes), n=1…8	

PAR.	LEV.	DESCRIPTION	U.M.	RANGE	DEFAULT
F1...F8		Setting the time for defrosts on weekends/public holidays If parameter dit (defrosting interval) is dit = 0, dCt = 3 and the RTC option is declared present, then parameters F1...F8 allow you to set the hours and minutes. Only on the basis of these values will a defrost cycle begin. If you do not wish to use some of the defrost times (F1...F8), exclude them as explained below: Select the parameter (F1...F8) that you want to exclude, then increase the value until 59 appears on the display, indicating that the parameter has been excluded. Bear in mind that the times do not have to be set in exact chronological order, e.g.: • F1 = h 12.25 • F2 = h 06.05 • F3 = h 18.30	hours/ mins	The parameter is then split into Fn_H (hours), Fn_m (minutes), n=1…8	
dE1H	USr/inS	Start time weekday defrost 1. 0...23 = start hour; 24 = disabled.	hours	0...24	0
dE1m	USr/inS	Start time minutes weekday defrost 1.	min	0...59	0
dE2H	USr/inS	2nd workday defrost start hour. d1H...23 = start hour; 24 = disabled.	hours	0...24	0

		NIGHT AND DAY (nAd) parameters **FOLDER ONLY VISIBLE IN HACCP MODELS**			
If the Night & Day regulator is enabled (via key or DI), both weekday and weekend defrost management is active (see parameters dE1…dE8, F1…F8): parameter E3 can be used for every day to establish which defrosts to activate. If the Night & Day regulator has not been enabled, only weekday defrosts dE1...dE8 will be run Folder consisting of 7 sub-folders: d0, d1, d2, d3, d4, d5, d6 and d7(°), each of which contain the following parameters. (°) NOTE: it is advisable to consider the first day d0 as SUNDAY. 'd7' can be used to program daily events which are valid for all days					
E0		Functions enabled during events. 0 = events management disabled 1 = enable reduced setpoint 2 = enable reduced set+light 3 = enable reduced set+light+aux 4 = enable stand-by	5 = enable reduced setpoint*. 6 = enable reduced set+light*. 7 = enable reduced set+light+aux*. 8 = enable stand-by*. * disables the buzzer; the alarms and alarm relay continue to run as per the programming		

PAR.	LEV.	DESCRIPTION	U.M.	RANGE	DEFAULT
E1		Start of event hours/minutes. Sets event start time based on the value of E0. The “NIGHT” mode begins at this time. The duration is determined by parameter E2 In hours and minutes (in the parameter table, the parameter is split into E1_h (hours), E1_min (minutes))			
E2		Duration of event. Sets the duration of the event starting as programmed in E1, based on the value of E0 In hours			
E3		Enable defrost weekdays or weekends: 0 = “weekdays” defrost sequence defined by parameters dE1...dE8. 1 = “weekends/holidays” defrost sequence defined by parameters F1…F8. NOTE: This regulator can be enabled by key (see para. H32...H37=11) or by Digital Input (see para. ...H11...H13=16) Note: for the daily event ‘d7’, this parameter is ignored (it is not possible to manage defrosts)

8. ALARMS

8.1. ALARMS AND SIGNALS TABLE

When an alarm condition is detected, the ALARM icon will come on
If present and enabled, the buzzer and alarm relay will also activate.
To silence the buzzer, press and release any key, the relative icon will continue to flash.
All alarms are reset automatically (i.e. they disappear when the issue that caused them is removed).

The alarm codes are as follows:

Code	Description	Alarm relay	Reset	Parameters used to ENABLE ALARM
E1	Pb1 probe error	**active**	Automatic	Ont, OFt
E2	Pb2 probe error	**active**	Automatic	Ont, OFt
E3	Pb3 probe error	**active**	Automatic	Ont, OFt
HA1	HIGH temperature alarm	**active**	Automatic	SP1, Att, AFd, HAL, LAL, PAO, dAO, OAO, tAO
LA1	LOW temperature alarm	**active**	Automatic	SP1, Att, AFd, HAL, LAL, PAO, dAO, OAO, tAO
EAL	External alarm	**active**	Automatic	PEA, rLO
OPd	Door open alarm	not active	Automatic	PEA, tdO
Ad2	Defrost end due to timeout	not active	Automatic	dEt, dE2, dAt
PAn	Panic alarm	not active	Automatic	
ALd	leak detector alarm	not active	Automatic	
Prr	Preheat alarm	not active	Automatic	
E10	Clock alarm	not active	Automatic	
PA	General pressure switch alarm	not active	**Manual**	PEn, PEi
LPA	Low pressure switch alarm	not active	**Manual**	PEn, PEi
HPA	High pressure switch alarm	not active	**Manual**	PEn, PEi

NOTES:

1. If alarm exclusion times have been set (see “ALr” folder in the Parameters table) the alarm will not be indicated.
2. With the exception of faulty probe alarms, all other alarms will record the corresponding label in the ALr folder (press UP key)
3. Faulty probe alarms will be indicated on the display by means of label E1, E2, E3 depending on whether the fault relates to probe Pb1, Pb2 or Pb3 respectively
4. In the event of an overlap between the “Panic” alarm and the “Refrigerant leakage” alarm, priority is given to the “Panic Alarm” with its operating modes. Both alarm codes can in any case be viewed in the alarms folder.

8.2. ALARM CAUSE/EFFECT TABLE

EWRC 300/500/5000 NT can run integral diagnostics on the installation, signalling any operating faults with specific alarms found, and record and signal any user-defined unusual events to have greater control over the system as a whole.

Label	Description	Cause	Effects	Remedy
E1	Probe Pb1 in error	• Measured values are outside operating range • probe errors/short-circuited/open	• Label E1 displayed • Alarm icon permanently alight	• Check probe type (H00) • Check probe wiring • Replace probe
E2	Probe Pb2 in error	• Measured values are outside operating range • probe errors/short-circuited/open	• Label E2 displayed • Alarm icon permanently alight	• Check probe type (H00) • Check probe wiring • Replace probe
E3	Probe Pb3 in error	• Measured values are outside operating range • probe errors/short-circuited/open	• Label E3 displayed • Alarm icon permanently alight	• Check probe type (H00) • Check probe wiring • Replace probe
HA1	HIGH temperature Temperature 1	value read by probe 1 > HA1 after time equal to tAO. (see “MAX/MIN TEMP. MAX/MIN)	• Label HA1 recorded in folder ALr • No effect on regulation	Wait until value read by the probe returns below HA1-AFd.
LA1	LOW temperature Temperature 1	Value read by probe 1 < LA1 after time equal to tAO. (see “MAX/MIN TEMP. MAX/MIN)	• Label LA1 recorded in folder ALr • No effect on regulation	Wait until value read by the probe returns above LA1+AFd.
HA3	HIGH temperature Temperature 3	with PbA = 1 or 2 Value read by probe Pb3> HAL after time equal to tAO. with PbA = 3 and dA3> 0 Value of probe Pb3> SA3 plus tA3 time	• Recording of label HA3 in folder ALr • No effect on regulation	Wait for value read by probe to return with PbA = 1 or 2 below threshold of HAL-AFd. with PbA = 3 and dA3> 0 below threshold of SA3-dA3.
LA3	LOW temperature Temperature 3	with PbA = 1 or 2 Value read by probe Pb3< LAL after time equal to tAO. with PbA = 3 and dA3< 0 Value of probe Pb3< SA3 plus tA3 time	• Recording of label LA3 in folder ALr • No effect on regulation	Wait for value read by probe to return with PbA = 1 or 2 above threshold of LAL-AFd. with PbA = 3 and dA3< 0 above threshold of SA3-dA3.
EAL	Alarm External	Digital input activated	• Label EAL recorded in folder ALr • Alarm icon permanently alight • Lockout of regulation as requested by rLO	Check and remove external cause of alarm on DI
OPd	Alarm Door Open	Digital input activated (for a time greater than tdO)	• Recording of label OPd in folder ALr • Alarm icon permanently alight • Lockout of regulation as requested by dOd	• Close the door • Delay preceding defined alarm signal by OAO.
Ad2	End Defrost due to timeout	end of defrost cycle due to timeout rather than due to defrost end temperature being read by Pb2.	• Recording of label Ad2 in folder ALr • Alarm icon permanently alight	Await next defrost cycle for automatic return to normal
Prr	Alarm Preheat	Alarm for preheat input regulator ON	• Label Prr recorded in folder ALr • Compressor icon blinking • Regulation inhibited (Compressor and Fans) NOTE: defrost will also be inhibited if it is hot gas defrost.	Preheat input regulator off
E10	Alarm Clock	• Clock faulty • Extended period without power	• Recording of label E10 in folder ALr • Functions associated with clock not managed	Connect the instrument to the power supply.

Label	Description	Cause	Effects	Remedy
P01 ... P99	Alarm general pressure switch	Pressure switch alarm activation by general pressure switch regulator.	If the number n of pressure switch activations is n<PEn: • Number of pressure switch activations recorded • Regulation inhibited (Compressor and Fans)	Check and remove external cause of alarm on DI (Automatic Reset).
PA	Alarm general pressure switch	Pressure switch alarm activation by general pressure switch regulator.	If the number n of pressure switch activations is n=PEn: • Label PA displayed • Recording of label PA in folder ALr • Alarm icon permanently alight • Regulation inhibited (Compressor and Fans)	• Switch the device off and back on again • Reset alarms using the rPA key (Manual Reset)
L01 ... L99	Alarm low pressure switch	Activation of pressure switch alarm by minimum pressure switch regulator.	If the number n of pressure switch activations is n<PEn: • Number of pressure switch activations recorded • Regulation inhibited (Compressor and Fans)	Check and remove external cause of alarm on DI (Automatic Reset).
LPA	Alarm minimum pressure switch	Activation of pressure switch alarm by minimum pressure switch regulator.	If the number n of pressure switch activations is n=PEn: • Label LPA displayed • Recording of label LPA in folder ALr • Alarm icon permanently alight • Regulation inhibited (Compressor and Fans)	• Switch the device off and back on again • Reset alarms using the rPA key (Manual Reset)
H01 ... H99	Alarm high pressure switch	Activation of pressure switch alarm by maximum pressure switch regulator.	If the number n of pressure switch activations is n<PEn: • Number of pressure switch activations recorded • Regulation inhibited (Compressor and Fans)	Check and remove external cause of alarm on DI (Automatic Reset).
HPA	Alarm maximum pressure switch	Activation of pressure switch alarm by maximum pressure switch regulator.	If the number n of pressure switch activations is n=PEn: • Label PHPA displayed • Recording of label HPA in folder ALr • Alarm icon permanently alight • Regulation inhibited (Compressor and Fans)	• Switch the device off and back on again • Reset alarms using the rPA key (Manual Reset)
PAn	Panic alarm	Activation of appropriately configured digital input	• Recording of PAn label in ALr folder • PANIC Alarm icon steadily on • Alarm icon steadily on • Temperature control is NOT inhibited when the alarm is active	Check and remove external cause of alarm on DI (Automatic Reset).
ALd	Alarm Refrigerant Leak	Activation of appropriately configured digital input	• Recording of ALd label in ALr folder • Panic Alarm icon blinking • Alarm icon steadily on • Intermittent buzzer sounding • Temperature control is NOT inhibited when the alarm is active	Check and remove external cause of alarm on DI (Automatic Reset).
ALL ALARMS • Alarm icon permanently alight • Buzzer (if present) and alarm relay (OUT5) activated, except Ad2 • Press any key to mute the alarm. The icon changes from steady to blinking. NOTE: the buzzer is deactivated while the alarm relay remains active *E1 - E2: If simultaneous they will be shown alternately on the display at a frequency of 2 seconds			REFRIGERANT LEAK ALARM (LEAK DETECTOR) • Blinking alarm icon and Alarm icon steadily on • Intermittent sounding of buzzer (if present) and alarm relay (OUT5) • Press any key to mute the alarm. In this case the Panic icon switches from blinking to steady while the alarm icon will blink.	

8.3. DESCRIPTION OF ALARMS

8.3.1. PROBE alarm

OPERATING CONDITIONS

When one of the probes is out of the nominal operating range or in the case of an open probe or a probe in short circuit, an alarm is generated if this condition persists for longer than 10 seconds.
The alarm condition is indicated on the display by means of the following error codes:

- **E1** = Pb1 probe error
- **E2** = Pb2 probe error
- **E3** = Pb3 probe error

The alarm icon and alarm relay are activated. Codes **E1**, **E2**, **E3**, when occurring at the same time,are shown in the following sequence: E1 x 2 seconds, E2 x 2 seconds, E3 x 2 seconds, etc.

ACTIONS ON CURRENT REGULATION

For all probes, the probe error condition causes the following actions:

- the display shows code E**x** (where **x** = 1, 2, 3)
- activation and permanent display of alarm icon and activation of alarm relay (if present)

When the faulty probe condition ceases, regulation resumes as normal.
During the probe error, the defrost interval count continues as normal.

SIGNALLING

Code	Meaning
E1	Probe Pb1 error
E2	Probe Pb2 error
E3	Probe Pb3 error

ALARM ACKNOWLEDGEMENT

In the alarm condition, it is possible to acknowledge the alarm and/or relay configured as an alarm, even if the alarm condition persists, by pressing any key or using the corresponding function in the menu. The alarm icon will start to blink.
Eliminating the cause of the alarm disarms the acknowledgement.
The probe alarm error is not stored by the controller.

USER PARAMETERS

Label	Description
Ont	ON time for compressor output with control probe error
OFt	OFF time for compressor output with control probe error

8.3.2. MINIMUM AND MAXIMUM TEMPERATURE alarm

OPERATING CONDITIONS

The alarm regulation is carried out on probe 1. The temperature limits defined in parameters **HAL** and **LAL** are determined by parameter **Att** which specifies if they represent the absolute temperature value or a setpoint differential (in the case of offset on the entered setpoint, the high and low alarms will refer to this new control set point).

- If **Att**=0 **Ab(solute)** , the temperature limits for probe 1/3 are absolute.
- If **Att**=1 **rE(lative)** , the temperature limits for probe 1/3 refer to the Setpoint **SEt**

NOTE: to obtain the minimum alarm below the setpoint in the case of **Att**=1 (relative) set **LAL** < 0

ALARM CONDITIONS

A maximum/minimum alarm is generated when the Pb1 temperature is:

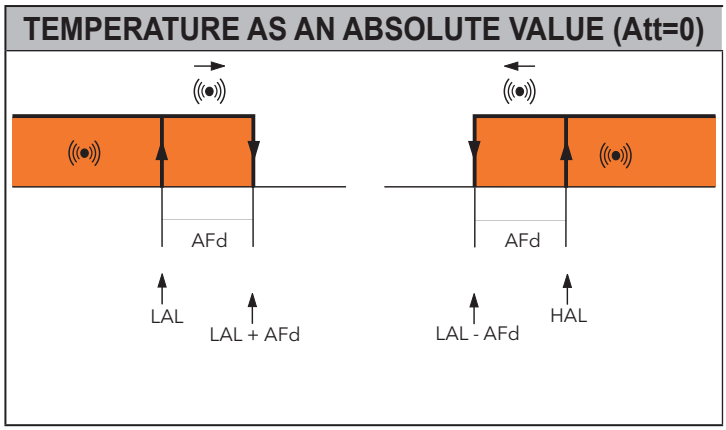
- Maximum alarm: ≥ **HAL** if **Att=Ab(solute)** and ≥ (**SEt + HAL**) if **Att=rE(lative)**
- Minimum alarm: ≤ **LAL** if **Att=Ab(solute)** and ≤ (**SEt + LAL**) if **Att=rE(lative)**

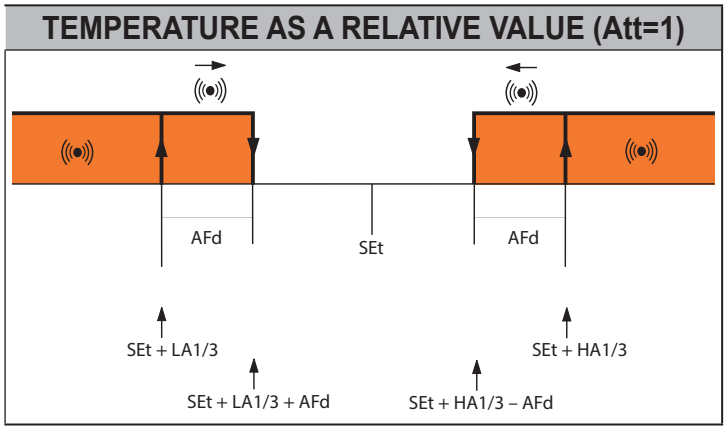
If**Att=Ab(solute)** the values of **HAL and LAL** must be with sign, if **Att=rE(lative)** it is necessary that **HAL > 0 and LAL < 0**.

When one of the two aforementioned conditions occurs, if no alarm override times apply (see alarm override parameters), the alarm icon lights up and the relay configured as alarm activates (if present).

The maximum/minimum alarm will be reset when the temperature of probe 1/2 is:

- Reset from maximum alarm: ≤ (**HAL - AFd**) if **Att=Ab(solute)** and ≤ (**SEt + HAL - AFd**) if **Att=rE(lative)**
- Reset from minimum alarm: ≥ (**LAL + AFd**) if **Att=Ab(solute)** and ≥ (**SEt + LAL + AFd**) if **Att=rE(lative)**





NOTES:
- During a defrost cycle, high and low temperature alarms are overridden.
- Occurrence of this alarm does not effect any regulation in progress.

SIGNALLING

Code	Meaning
HA1	HIGH temperature alarm, refers to probe
LA1	LOW temperature alarm, refers to probe

ALARM ACKNOWLEDGEMENT

In the alarm condition, it is possible to acknowledge the relay configured as an alarm (if present), even if the alarm condition persists, by pressing any key or using the corresponding function in the menu. The alarm icon will start to blink.
Eliminating the cause of the alarm disarms the acknowledgement.
The probe alarm error is not stored by the controller.

HIGH AND LOW TEMPERATURE ALARM OPERATION WITH DOOR OPEN

• If **Art = 0** (regulation of temperature alarms disabled with door open)
  1. If the door is open and there is no temperature alarm, the alarms are inhibited and cannot be activated;
  2. If the door is opened, the temperature alarm must continue;
  3. If the temperature alarm is triggered and the door is open, the temperature alarm will cease when the reset conditions return.

• If **Art = 1** (temperature alarms enabled with door open)
  1. If the door is open, the temperature alarms are not inhibited and can be activated if the required conditions are in place. The delay **OAO**, referred to the previous closing of the door, is not counted.
  2. If a temperature alarm is triggered with the door closed, on opening the door the temperature alarm must continue.
  3. If the temperature alarm is present with the door open, the temperature alarm will cease when the reset conditions return.

USER PARAMETERS

Label	Description
Att	HAL and LAL parameter mode (absolute or relative)
AFd	Alarm activation differential
HAL	Probe maximum alarm threshold
LAL	Probe minimum alarm threshold
PAO	Temperature alarm exclusion time from power-on
dAO	Temperature alarm disabling time after defrost cycle
OAO	High/low temperature alarm exclusion time after door closing
tAO	Temperature alarms delay time
Art	Regulator alarm type

8.3.3. END OF DEFROST DUE TO TIMEOUT alarm

OPERATING CONDITIONS

The regulator is activated without any delay in the case of end of defrost due to timeout, instead of probe 2 reaching the defrost end temperature.
The action consists of:

- alarm icon steadily on
- recording of Label **Ad2** in the alarms menu.

Automatic reset occurs with the start of the next defrost cycle.
The alarm icon can be switched off using the normal acknowledgement procedure, although the alarm signal is only actually cancelled at the start of the next defrost cycle.

SIGNALLING

Code	Meaning
Ad2	Defrost alarm on Pb2

USER PARAMETERS

Label	Description
dEt	Evaporator 1 defrost timeout
dE2	Defrost timeout evaporator 2
dAt	Alarm signalling end of defrost due to timeout

8.3.4. EXTERNAL alarm

OPERATING CONDITIONS

In the case of activation of the digital input, the alarm regulator is activated with the delay set by parameter **dAd**, and this alarm persists until the next time the digital input is deactivated.
The action consists of:

- alarm icon steadily on
- recording of Label **EAL** in the alarms menu.
- Activation of the relay configured as alarm (if enabled)
- deactivation of regulation if parameter **rLO** requires it.

It is possible to mute the alarm relay but the regulators still remain locked until the next time the digital input is deactivated.

The values that **rLO** can be assigned to parameter:

- **rLO = 0**: an external alarm has not locked any resource;
- **rLO = 1**: an external alarm has locked the compressor and defrost;
- **rLO = 2**: an external alarm has locked the compressor, defrost and the fans.

SIGNALLING

Code	Meaning
EAL	External alarm

USER PARAMETERS

Label	Description
rLO	An external alarm blocks the regulators

8.3.5. DOOR OPEN alarm

OPERATING CONDITIONS

The door switch alarm is associated to a specially configured digital input:

- **H11, H12, H13 = ± 4**

On activation of the digital input (door open) and after delay **tdO** has elapsed, the door open alarm must be signalled in the alarms folder and the icon and alarm relay should come on. The label **OPd** is displayed.
The action consists of:

- alarm icon steadily on
- recording of Label **OPd** in the alarms menu.
- Activation of the relay configured as alarm

As in the case of the other alarms, the relay may be disabled by pressing an acknowledgement key, the alarm icon will blink and label **OPd** will remain in the alarms menu until the door is closed.
If the door is opened, the regulator will operate on the basis of the value of parameter **dOd**. The values that can be assigned to it are:

- **dOd = 0**: no resource is locked;
- **dOd = 1**: fans are locked (FAN);
- **dOd = 2**: the compressor is locked (COMPR);
- **dOd = 3**: both the fans (FAN) and compressor (COMPR) are locked

If the door open alarm locks the compressor, it can still be reactivated even if the door remains open, by setting the parameter **dCO**.

SIGNALLING

Code	Meaning
OPd	Door open alarm

USER PARAMETERS

Label	Description
dOd	Digital input for switching off loads: **0** = disabled; **1** = disables the fans; **2** = disables the compressor; **3** = disables fans and compressor.
dCO	Compressor activation delay from acknowledgement
tdO	Open door disabling time

8.3.6. PRESSURE SWITCH INPUT alarm

OPERATING CONDITIONS

The pressure switch is associated with a suitably configured Digital Input and can be general, minimum or maximum.

NOTE: behaviour and configuration parameters are the same for all three types.

Every time pressure switch input activation causes the compressor/fans to be disabled instantly, with only visual indication of the activation (WARNING) provided via illumination of the alarm icon and recording of the number of pressure switch activations that have taken place.

If the pressure switch Digital Input is deactivated, the compressor starts up again and the alarm icon switches off, but the alarm folder still contains the number of activations recorded in the previous counting interval (defined using parameter PEi). Once the number of activations set in parameter **PEn** has been reached **PA** (general), **LPA** (minimum) or **HPA** (maximum) will appear on the display.

Compressor, fans and defrosts are deactivated, the alarm icon lights up and the alarm relay comes on if configured.
Once the device has entered alarm mode, it must be switched off and on again, or a key-activated reset performed using the function **rPA** (reset pressure switch alarm) on the functions menu.

NOTA: **PEn** represents the number of pressure switch activations within the interval defined in parameter PEI, which determines activation of alarm mode and deactivation of the compressor, fan and defrost outputs
If **PEn = 0** the function is excluded and the pressure switch alarm is ignored.

SIGNALLING

Code	Meaning
PA	General pressure switch alarm
LPA	Minimum pressure switch alarm
HPA	Maximum pressure switch alarm

USER PARAMETERS

Label	Description
PEn	Number of errors allowed per pressure switch input. **0** = disabled.
PEi	Pressure switch error count interval.

8.3.7. PANIC alarm

OPERATING CONDITIONS

The panic alarm is associated to a specially configured digital input:

- **H11, H12, H13 = ± 18**

After the delay set in parameter dAd, this alarm is activated and persists until the next digital input deactivation.
The action consists of:

- Panic alarm icon steadily on
- Alarm icon steadily on
- recording of label PAn in the alarms menu.
- activation of the relay configured as alarm (if enabled)

SIGNALLING

Code	Meaning
PAn	Panic alarm

USER PARAMETERS

Label	Description
dAd	Activation delay DI1, DI2
di3	Activation delay DI3

8.3.8. Leak detector ALARM

OPERATING CONDITIONS

The refrigerant leak (Leak Detector) alarm is associated with an appropriately configured digital input.

- **H11, H12, H13 = ± 21**

This alarm is activated after the delay set in parameter **di3** and it persists until the next digital input deactivation.
The action consists of:

- Panic alarm icon blinking
- Alarm icon steadily on
- intermittent sounding of alarm buzzer
- recording of Label “ALd” in the alarms menu
- activation of the relay configured as alarm (if enabled)

The alarm relay can be inhibited by pressing any key; this action mutes the buzzer while the icons respond as follows:

- alarm icon blinking
- Panic alarm icon steadily on

If the “Leak Detector” alarm occurs in synchrony with the “Panic” alarm, the system response is as follows:

- Panic alarm icon steadily on
- Alarm icon steadily on
- intermittent sounding of buzzer
- recording of labels “**Pan**” and “**ALd**” in the alarms menu

As long as the Panic alarm persists it will not be possible to mute the buzzer from the keypad.

SIGNALLING

Code	Meaning
ALd	Leak Detector Alarm

USER PARAMETERS

Label	Description
dAd	Activation delay DI1, DI2
di3	Activation delay DI3

9. MODBUS MSK 554 /812 FUNCTIONS AND RESOURCES

ModBUS is a client/server protocol for communication between devices connected in a network.
ModBUS devices communicate using a master-slave technique in which only one device (master) can send messages.
The other devices in the network (slave) respond, returning the data requested by the master or executing the action contained in the message sent.
A slave is a device connected to a network that processes information and sends the results to the master using the ModBUS protocol.
The master device can send messages to individual slaves or to the entire network (broadcast) whilst slaves can only respond individually to the master.
The ModBUS standard used by Eliwell employs the RTU code for data transmission.

9.3.1. DATA FORMAT (RTU)

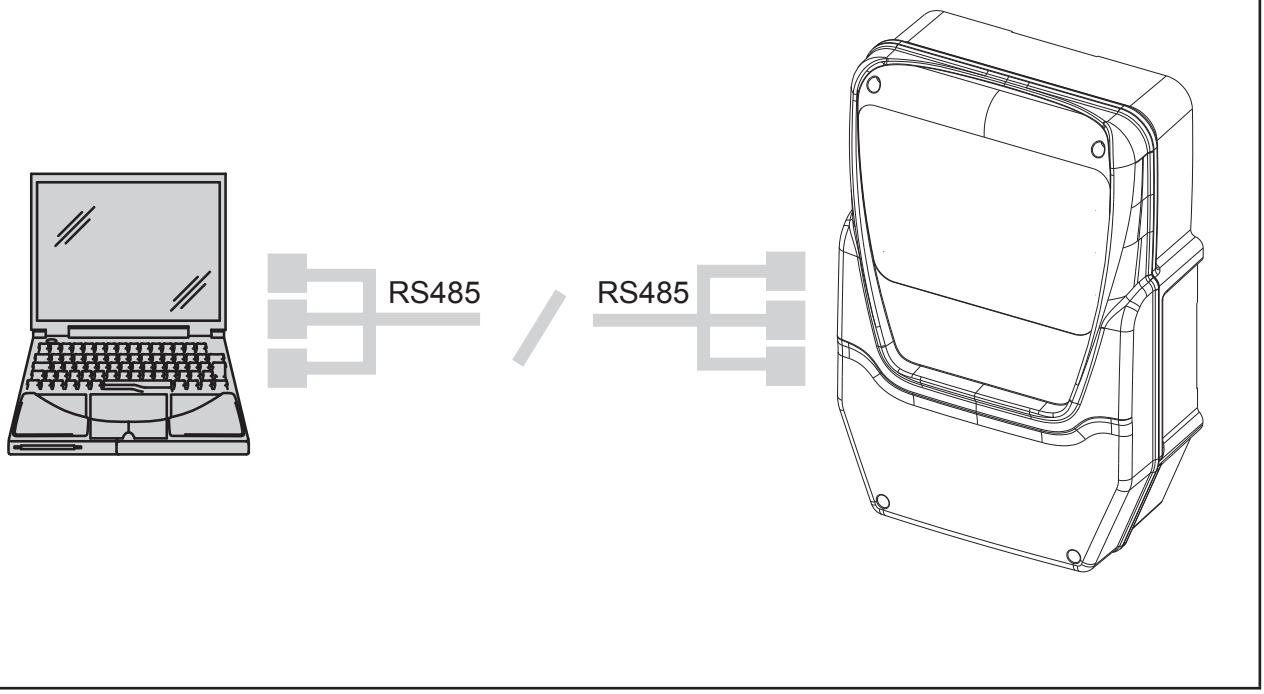
The coding model used defines the structure of messages transmitted on the network and the way in which this information is deciphered. The type of coding is usually selected on the basis of specific parameters (baudRate, parity, etc.); furthermore, some devices support only specific coding models, although it must be the same one for all devices connected in a ModBUS network.
The protocol uses the RTU binary method with bytes configured as follows: **8 bits for data (non-configurable), parity bit none, 1 stop BIT.**

Parameter setting allows the integral configuration of the device
Changes can be made via:

- Device keypad
- UNICARD / Copy Card
- data via Modbus protocol directly to an individual controller or broadcasting it, using the address 0 (broadcast)

9.3.2. NETWORK

ModBUS connection via RS-485



9.3.3. ModBUS COMMANDS AVAILBLE AND DATA AREAS

The following commands are implemented:

<table>
<tr><th>ModBUS command</th><th>Command description</th></tr>
<tr><td>03 (hex 0x03)</td><td>Read 16 consecutive registers for Client side.</td></tr>
<tr><td>04 (hex 0x04)</td><td>Read 1 single register for parameters.</td></tr>
<tr><td>16 (hex 0x10)</td><td>Write 15 consecutive registers for Client side</td></tr>
<tr><td>22 (hex 0x16)</td><td>Write 1 register for the parameters</td></tr>
<tr><td>43 (hex 0x2B)</td><td>Read device ID.
It is possible to read the following 3 fields:
<table>
<tr><th>Field code</th><th>Field description</th></tr>
<tr><td>0</td><td>Manufacturer ID (=”Invensys”)</td></tr>
<tr><td>1</td><td>Device model/polycarbonate ID
format: 00FB_0401
PCH = 251 (FB hex) POLI = 1025 (0401 hex)</td></tr>
<tr><td>2</td><td>Device family (MSK554)/version ID
format: 022A_0259
MSK = 554 (22A hex) REL = 0601 (259 hex)</td></tr>
</table></td></tr>
</table>

9.3.4. ADDRESS CONFIGURATION

The serial TTL - which we will call COM1 – can be used to configure the device, parameters, states, and variables with ModBUS via the ModBUS protocol.

The address of a device within a ModBUS message is set using the parameter **Adr**.

The address 0 is used for broadcast messages that all slaves recognise. Slaves don’t respond to broadcast messages.
The parameters for configuring the device are:

Parameter	Description	Values	Range
PtS	Select COM1 (TTL) protocol	d	t = Televis d = ModBUS
Adr	ModBUS protocol controller address	1	1...250
Pty	ModBUS protocol parity bit	n	• n= NONE • E = EVEN (parity) • o = ODD (disparity)
bAU	Baudrate selection.	96	• 96 = 9600 baud • 192 = 19200 baud • 384 = 38400 baud

NOTE: for correct operation, the controller must be switched off and switched on again after modification

9.3.5. PARAMETER VISIBILITY AND VALUES

NOTE:

1) When not indicated otherwise, the parameter is always visible and modifiable, unless customised settings have been configured by the user via serial
2) If folder visibility is modified, the new setting will apply to all parameters in the folder.

9.3.6. MODBUS TABLES

The tables below list all information required to read, write and decode all accessible resources in the device. There are 3 tables:

- the "**PARAMETER TABLE**"contains all device configuration parameters stored in the controller's non-volatile memory, including visibility
- the "**FOLDER VISIBILITY TABLE (FOLDER)**" indicates the visibility of the folders containing the parameters
- the "**CLIENT TABLE**" includes all I/O and alarm status resources available in the volatile memory of the instrument.

Description of the columns:

FOLDER
Indicates the label of the folder containing the parameter in question

LABEL
Indicates the label used to display the parameters in the menu of the controller.

PAR. VALUE ADDRESS
The whole part represents the address of the ModBUS register containing the value of the resource to be read or written in the controller. The value after the decimal point indicates the position of the most significant data bit inside the register; if not indicated it is taken to be zero. This information is always provided when the register contains more than one information item, and it is necessary to distinguish which bits actually represent the data (the working size of the data indicated in the column DATA SIZE is also taken into consideration).
Given that the ModBUS registers have the size of one WORD (16 bit), the index number after the point can vary from 0 (least significant bit -LSb-) to 15 (most significant bit -MSb-).
Examples (in binary form the least significant bit is the first on the right):

PAR. VALUE ADDRESS	DATA SIZE	Value	Content of register	
8806	WORD	1350	1350	(0000010101000110)
8806	BYTE	70	1350	(00000101**01000110**)
8806.8	BYTE	5	1350	(**00000101**01000110)
8806.14	1 BIT	0	1350	(0**0**000010101000110)
8806.7	4 BIT	10	1350	(00000**1010**1000110)

IMPORTANT: when the register contains more than one piece of data, the writing procedure is as follows:

- Read current value of register
- Modify bits for the resource concerned
- Write register

VIS PAR. ADDRESS
The same as above. In this case, the ModBUS register address contains the visibility value of the parameter.
By default all parameters have:

- Data size 2 bit
- Range 0…3
- **Visibility 3
- U.M. num

****Value Meaning**

- Value 3 = parameter or folder always visible
- Value 2 = **installer level**; these parameters can only be viewed by entering the manufacturer password (see parameter PS2) (all parameters specified as always visible, parameters visible at the installer level and manufacturer level will be visible)
- Value 1 = **user level**; these parameters can only be viewed by entering the installer password (see parameter PS1) (all parameters specified as always visible and parameters visible at the installer level will be visible)
- Value 0 = parameter or folder NOT visible

1. Parameters and/or folders with a level of visibility =**1,2** (password-protected) will be visible only if the correct password is entered (installer or user) following this procedure:

2. Parameters and/or folders with a level of visibility =3 are always visible even without a password: in this case, the following procedure is not necessary.

Examples (in binary form the least significant bit is the first on the right):

Default visibility:

PAR. VALUE ADDRESS	DATA SIZE	Value	Content of register	
49336.6	2 BIT	3	65535	----------(0000000**11**11111111111111)
49337	2 BIT	3	65535	(0000000011111**11**11111111)
49337.2	2 BIT	3	65535	(0000000011111**11**1111111111)
49337.4	2 BIT	3	65535	(0000000011**11**111111111111)
49337.6	2 BIT	3	65535	(0000000**11**11111111111111)

R/W
Indicates the option of reading or writing the resource

R	The resource is read-only
W	The resource is write-only
RW	The resource can be both read and written

DESCRIPTION
This is the description of the meaning of **parameters** in the **LABEL** column.

DATA SIZE
Indicates the size of the data in bits.

WORD	=	16 bit
Byte	=	8 bit
“n” bit	=	0...15 bit based on the value of “n”

CPL
When the field indicates “Y”, the value read by the register needs to be converted because the value represents a number with a sign. In the other cases the value is always positive or null.
To carry out conversion, proceed as follows:

- if the value in the register is between 0 and 32,767, the result is the value itself (zero and positive values)
- if the value in the register is between 32,768 and 65,535, the result is the value of the register – 65,536 (negative values)

EXP
WHEN UTILISING MODBUS PROTOCOL ONLY
If = -1 the value read by the register is divided by 10 (value/10) to convert it to the values indicated in the RANGE and DEFAULT columns using the unit of measure indicated in the column U.M.

Example: parameter HSE = 50.0. Column EXP = -1:

- The value read by the device /DeviceManager is 50.0
- The value read by the register is 500 --> 500/10 = 50.0

RANGE
Describes the interval of values that can be assigned to the parameter. It can be correlated with other parameters in the instrument (indicated with the parameter label).

U.M.
Unit of measure for values converted according to the rules indicated in the CPL and EXP columns.

9.3.7. PARAMETER/VISIBILITY table

NOTE: ModBUS read command: 04 (0x04) and ModBUS write command: 22 (0x16)

10. ADVANCED FUNCTIONS - NIGHT AND DAY

Events and cycles can be programmed at set times during the week using the Night&Day regulator algorithm. The parameters concerned are contained in folder **nAd** / subfolders **d0…d6, Ed**

NOTA: do not confuse labels **E0 … E3** with probe error messages **E1 … E2…**

NOTE: be careful as to how **E0 = 3** (stand-by regulator) is used. You may not have access to the device for the duration of the event set in **E2.**

10.1. DAY/NIGHT REGULATOR OPERATION

Different events for days of the week
For each day of the week, indicated by parameters/(sub-folders) **d0 … d6**, you can set:

- a time for the start of the event (**E1, in format HH:mm**)
- the duration (**E2**)
- which functions to enable (**E0**) for the event
- which defrost group to enable (parameters **dE1..dE8 weekdays** or **F1…F8 weekends/holidays**) (**E3**).

Parameters **E0 … E3**, can be different for each day.
According to the time set, E1 is the start time, usually set for the Reduced set (Economy) function ("NIGHT" mode). The duration is determined by parameter E2. In this mode, parameter E0 allows you to:

- Activate the reduced set functions.
- Activate the light regulator.
- Activate the aux regulator.
- Activate the stand-by regulator.

You can also decide whether to enable defrost during weekdays (E3 = 0) and weekends/public holidays (E3 = 1).

NOTE that parameter **E3** has no effect on the daily event settings.

Daily event
Using the same parameters, E0 … E3 in the (sub-)folder Ed, you can also program a daily event, i.e. one that runs every day. Defrosts cannot be managed with this function. Hence parameter E3 in (sub-) folder d7 is not listed.

Daily or weekly events all have the same priority.

Days of the week correspond to these parameters:

Par.	Day of week	Day #
d0	Sunday	day 1
d1	Monday	day 2
d2	Tuesday	day 3
d3	Wednesday	day 4
d4	Thursday	day 5
d5	Friday	day 6
d6	Saturday	day 7
d7	Daily event (Every Day)	Daily event (Every Day)

10.2. OPERATION WITH DEFROST GROUP

If E0 is not equal to 0, the meaning of weekday parameters dE1…dE8 shifts from:
Defrost group valid EVERY day (see Automatic defrost with Real Time Clock.)
to:
Defrost group applicable only to weekdays.

The weekday parameters dE1…dE8 are supplemented with the management of weekend/public holiday parameters F1…F8.
Both folders still make use of the conditions for defrost at a pre-established time.

Hence for each day d0…d6 we can determine whether:
- E3 = 0, so that defrosts run at the times set in dE1…dE8.
- E3 = 1, so that defrosts run at the times set in F1…F8.

Example
Supposing you set these time configurations:
- 3 “weekend” defrosts (when the refrigerated cabinet is not being intensively used)
  - 2 am (F1=> h02 ‘00)
  - 10 am (F2=> h10 ‘00)
  - 6 pm (F3=> h18 ‘00)
- 4 defrosts on “weekdays” (or days when the refrigerated cabinet is used intensively)
  - 5 am (dE1=> h05 ‘00)
  - 11 am (dE2=> h11 ‘00)
  - 5 pm (dE3=> h17 ‘00)
  - 11 pm (dE4=> h23 ‘00)

if the days considered as weekends/holidays are Sunday and Monday, this means the day settings will be:
- d0 / E3 = 1 (Sunday = “weekend” day)
- d1 / E3 = 1 (Monday = “weekend” day)
- d2 / E3 = 0 (Tuesday = “weekday”)
- d3 / E3 = 0 (Wednesday = “weekday”)
- d4 / E3 = 0 (Thursday = “weekday”)
- d5 / E3 = 0 (Friday = “weekday”)
- d6 / E3 = 0 (Saturday = “weekday”)

10.3. DAY/NIGHT REGULATOR DURING A BLACKOUT

- If a blackout occurs during day/night status activation (i.e. caused by a day/night event), and power is restored:
  - during this event, the instrument will return to the status implemented at the time of the blackout, before disabling the event at the programmed time.
  - If it occurs after this event but before the next day/night event, the device starts up as if it has disabled the day/night event during which the blackout occurred.
  - If it occurs after this event but during the next day/night event, the device starts up as if it has disabled the day/night event during which the blackout occurred, before switching to the status requested by the day/night event underway when power was restored.
- Manual events (key or digital input) have priority over the day/night status until the next day/night event (event that either disables the current status or activates the next one) if the power supply is uninterrupted.
- If a manual event inverts the status set by the day/night function within the day/night status activation period and this is followed by a blackout, and power is restored:
  - During the same day/night status activation, the controller will return to the status set by the manual event before disabling the event at the programmed time.
  - If it occurs after this event, the device starts in the status set by the manual event.
  - It if occurs after this event but during the status activation of the next day/night event, the controller switches to the status requested by the day/night event concerned before disabling the event at the programmed time.

10.4. OPENING FOLDER NAD - DAY/NIGHT

Display	description
	Press SET for 3 seconds
	Folder USr appears Use the UP & DOWN keys to search for the InS folder Press and release the SET key
	Use the UP & DOWN keys to search for the nAd folder
	Press and release the SET key. Press and release the SET key to open the folder
	The first day, d0, appears Scroll using ‘UP’ and ‘DOWN’ to access the other days d1...d6 and Every Day d7 Press and release the SET key
	The first parameter E0 appears Press and release the SEt key to modify it The E0 label will blink Use the UP & DOWN keys to adjust its value
	The first parameter E0 appears Press and release the SEt key to modify it The E0 label will blink Use the UP & DOWN keys to adjust its value
	Press the ESC key several times to return to the normal display, or repeat the procedure to modify another parameter NOTE: in the case of parameter E1, the clock icon will appear. Modification takes place in the same way as the time setting procedure (see User Interface)

11. ADVANCED FUNCTIONS - HACCP

To meet the minimum requirements prescribed in HACCP regulations, there is a set of dedicated parameters. These parameters can be viewed and configured in folder:

HACCP (folder with label “HAC”)

The recording of HACCP alarms can be enabled in parameter H50≠0
NOTE. SWITCH THE INSTRUMENT OFF AND ON AGAIN AFTER MODIFYING PARAMETER H50

HACCP alarm START and storing begins every time the alarms are cleared - see paragraph Deleting HACCP alarms

These parameters record and file the high and low temperature alarms for cold room probe Pb1 or display probe Pb3, as well as any instrument power failures.

In addition to alarms, these parameters also record any controller blackouts, saving the number of blackouts that have occurred since the last time the machine was stopped.
Alarms for the HACCP function are managed independently from the rest of the regulators.

Each HACCP alarm consists of a folder containing the following information:
- alarm number: up to 40 alarms can be saved: 20 for high/low temperature and 20 for power failure
- type of alarm: Ht (high temperature), Lt (low temperature) and PF (Power failure)
- time/date and duration of all alarms
- maximum or minimum temperature, with corresponding time/date, reached during the event

SLi, SHi parameters Instant HACCP alarm
When a temperature value exceeds the range defined by parameters SLi and SHi, an HACCP alarm is signalled and recorded.
This threshold indicates the limit beyond which the food concerned would deteriorate irreparably, even for brief periods of time.

SLL, SHH parameters HACCP alarm
When a temperature value exceeds the range defined by parameters SLL and SHH for a time greater than the drA parameter, an HACCP alarm is signalled and displayed

11.1. DISPLAYING HACCP ALARMS

Display	description
	The red HACCP icon will remain permanently on to indicate an HACCP alarm has occurred Press and release the UP key The top display will show ALr If HACP alarms have occurred the bottom display will show HACP Press and release the SET key
	To access the information contained within each AHC folder, press the 'set' key
	The clock icon will be steadily on In fact, label StA will be shown on the top display, while the alarm start time will appear on the bottom display Use the DOWN key to scroll through the other alarm data
	The date icon will be steadily on In fact, label StA will be shown on the top display, while the alarm activation date will appear on the bottom display Use the DOWN key to scroll through the other alarm data
	Label dur will be shown on the top display, while the alarm duration will appear on the bottom display In HH:mm If --.— appears the alarm is still active Use the DOWN key to scroll through the other alarm data
	The clock icon will be steadily on …and the maximum temperature measured by the probe during the alarm (on the top display) will be displayed along with the relative time (on the bottom display). Use the DOWN key to scroll through the other alarm data
	The clock icon will be steadily on …and the maximum temperature measured by the probe during the alarm (on the top display) will be displayed along with the relative date (bottom display.) Use the DOWN key to scroll through the other alarm data
	To return to the alarm display screen (label AHC) press the ESC key once Press the ESC key several times to return to the normal display
